DR 2 (12 2 41)

Figure 1 shows a vertical cross-section of a sediment core. The vertical axis represents depth in centimeters, ranging from 0 at the top to 12 at the bottom. The core is divided into 12 distinct layers, each labeled with a number from 1 to 12. The layers vary in thickness and texture, with some appearing more homogeneous and others showing more complex internal structures. The core is shown in a vertical orientation, with the top layer (1) at the surface and the bottom layer (12) at the deepest point shown.
