Dam Monitoring Survey Reports

Purpose:

The State of California Division of Safety of Dams (DSOD) retains the responsibility of supervision of dams and reservoirs. DSOD requests periodic monitoring of dams to determine if they are stable. Monitoring may be requested at different intervals due to special circumstances such as earthquakes. OC Public Works Operations and Maintenance Division select which dams require monitoring and the elapsed time period for such surveys. Current dams being monitored with their interim are listed below:

#	Facility #	Dam	2012	2013	2014	2015	2016	2017	2018	2019
1	E08D01	Villa Park Dam	✓	✓	✓	✓	✓	✓	✓	✓

Monitoring Procedures:

PHASE I

Utilizing Global Navigation Satellite System (GNSS) Static survey techniques, measure at least two of the dam monitoring control stations to at least two O.C.S. horizontal control stations or two Continuous Global Positioning System (CGPS) stations which are located outside of the dam area. GNSS data is post-processed and a minimally constrained adjustment is done constraining the same singular control station for each survey year. Positions are compared from each survey year. This data is used to check the stability, horizontally and vertically, of the two dam monitoring stations. This information is not included in the report unless significant movement is found but can be obtained at OC Survey Section, Geodetic Control Unit.

PHASE II

Utilizing Precise leveling techniques following 2nd Order - Class II specifications, measure the vertical differences between all dam monitoring stations relative to an O.C.S. Vertical control station located outside the dam area. This data is used to monitor any subsidence and/or uplift on the dam monitoring stations.

PHASE III

Utilizing terrestrial or GNSS surveying techniques, measure station and offsets for each dam monitoring stations from the dam monitoring control stations. This data is used to monitor the horizontal movement on the dam monitoring stations.

COMMENTS:

Each annual survey is done using the same techniques with the same survey equipment if possible. Each survey report has a brief "Report Summary" that contains comments on each survey. Detailed information pertaining to monument descriptions and survey information are not included in the reports, but can be obtained at OC Survey Section, Geodetic Control Unit.

No evaluation of Subsidence or Deformation is determined by these reports. The intent of these reports are to provide survey data to assist the reader in the determination of the stability of these structures.

Four chart examples have been included explaining how to read and interpret each chart. These reports and data represent surveys made by me and/or under my direction.

Arthur Ringland Andrew III, P.L.S. #7042

VILLA PARK DAM

Villa Park Dam

Villa Park (Main) Dam

Villa Park Dam (Main Dam) (E08D01) - Monitoring Survey

10/16/2013

This earthen dam was built in 1963. The first survey was performed in 1963. This report displays all surveys from 1963 to present. Horizontal displacement is compared to dam survey line. Vertical displacement are compared to the 1963 survey.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Control points "VP-18" ("VP-18A" after 1993) and "VP-19" are held for *Out From Line* and along line calculations.

Positive numbers represent monitored stations to the right of line (downstream), negative numbers represent monitored stations to the left of line (upstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Control points "VP-18" ("VP-18A" after 1993) are held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the elevation to the "1963 survey" elevation.

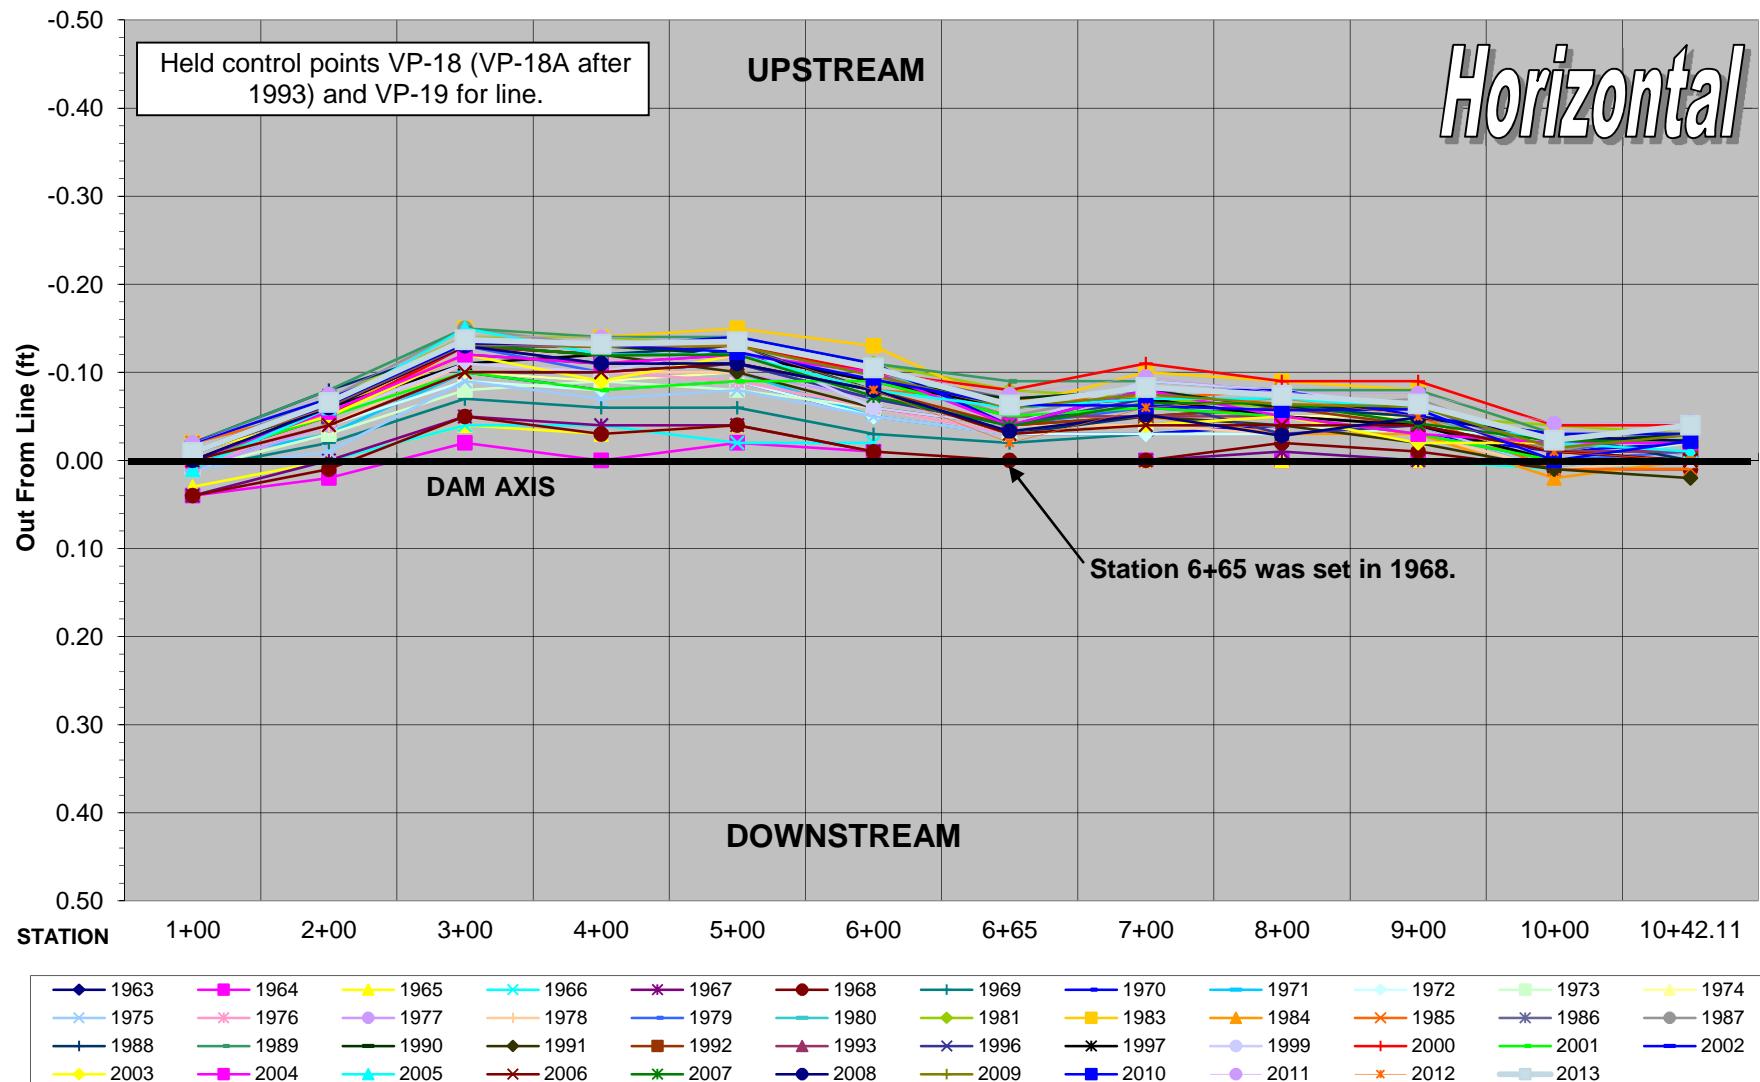

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values are shown in U.S. Feet.

Report Summary

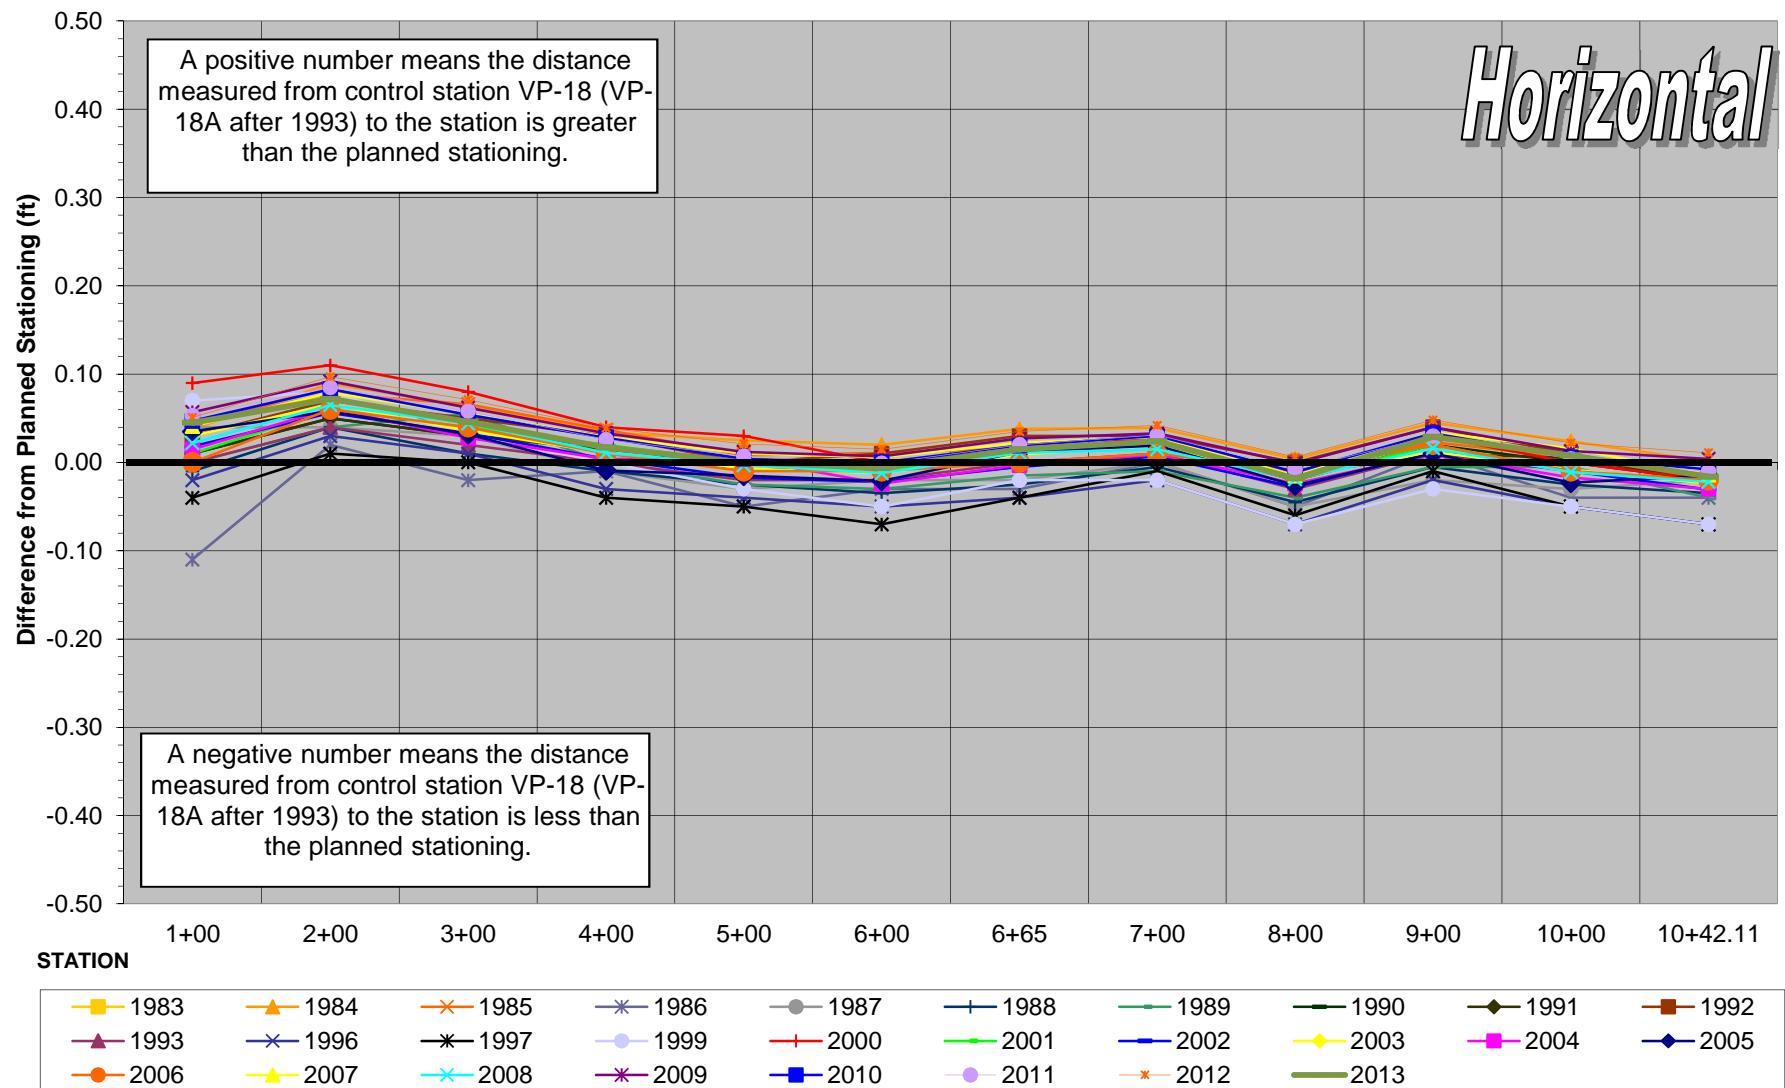

- 1963-1973** Gradual subsidence measured due to settling of dam. Upstream horizontal movement measured, mostly concentrated around stations 3+00 thru 5+00.
- 1974-1977** Upstream horizontal movement and subsidence still measured. Rates are Gradually slowing.
- 1978-1988** Subsidence continues at a very slow rate. Horizontal appears stable.
- 1989-2000** Vertical subsidence has discontinued. Horizontal appears stable.
- 2001** No significant movement detected.
- 2002** No significant movement detected.
- 2003** No significant movement detected.
- 2004** No significant movement detected.
- 2005** No significant movement detected.
- 2006** No significant movement detected.
- 2007** No significant movement detected.
- 2008** No significant movement detected.
- 2009** No significant movement detected.
- 2010** No significant movement detected.
- 2011** No significant movement detected.
- 2012** No significant movement detected.
- 2013** No significant movement detected.

Vertical

Villa Park (Auxiliary) Dam

Villa Park Dam (Auxiliary Dam) - Monitoring Survey

10/16/2013

The first survey was performed in 1980. This report displays surveys from 1980 to present.

Horizontal displacement is compared to dam survey line. Vertical displacement is compared to 1980 survey.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Station "100+00" and "VP-19" are held for ***Out From Line*** calculations for station 101+00.

Station "VP-19" and "VP-30" are held for ***Out From Line*** calculations for station 102+00.

Station "VP-30" and "VP-32" are held for ***Out From Line*** calculations for station 104+00 to 112+00.

Positive numbers represent monitored stations to the right of line, (upstream), negative numbers represent monitored stations to the left of line (downstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Station "VP-30", VP-32 and "VP-19" are held for ***Along Line*** calculations.

Control point VP-30 and VP-19 are held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the elevation to the "1980 survey" elevation.

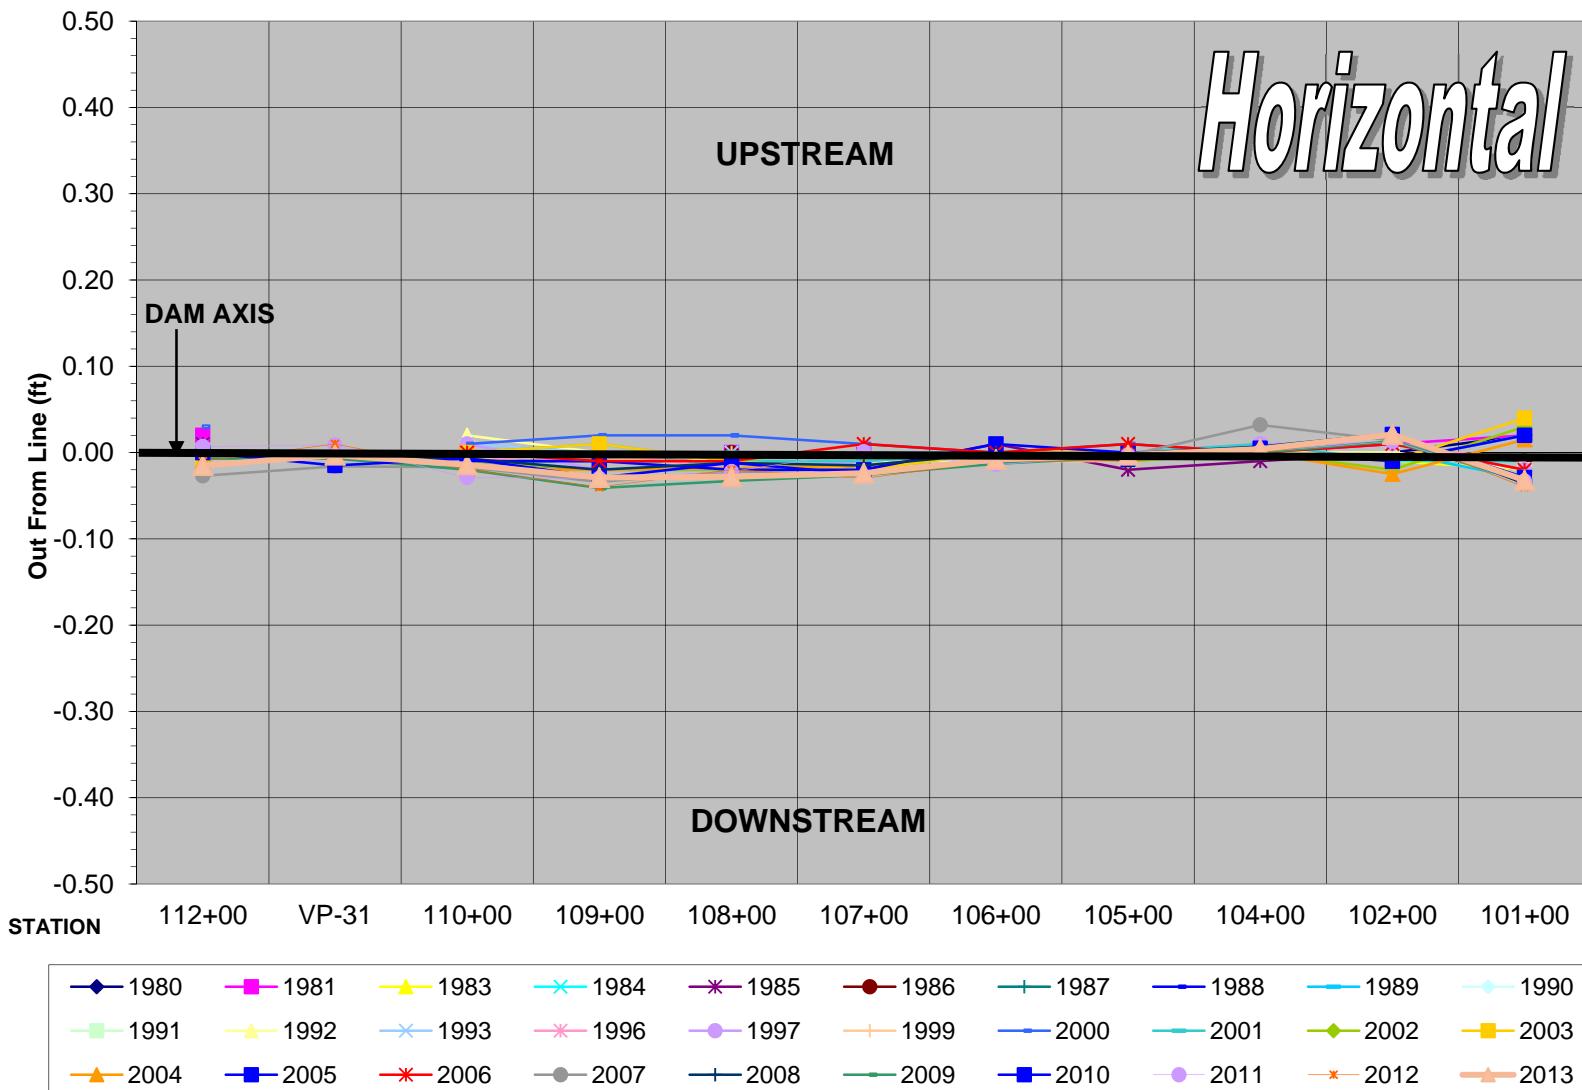

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values are shown in U.S. Feet.

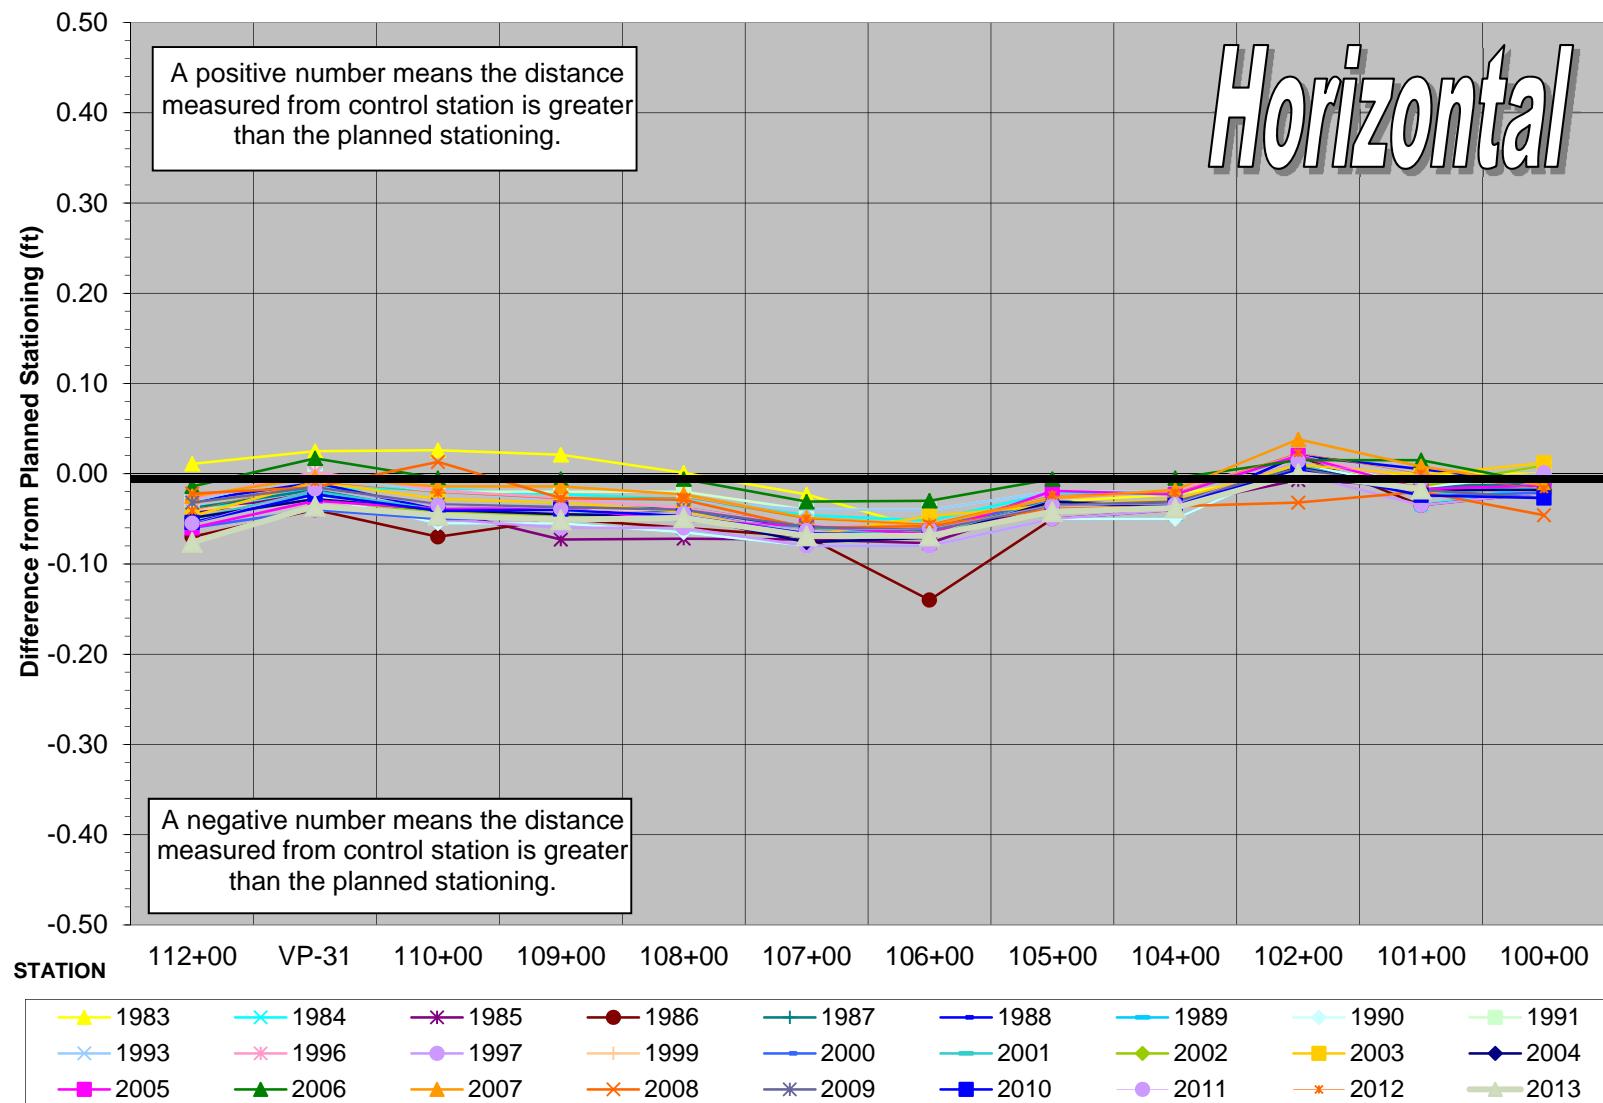

Report Summary

- 1980-1990** Monuments appear to be stable horizontally and vertically. No significant movement detected.
- 1991-2000** Monuments continue to be stable horizontally and vertically. No significant movement detected.
- 2001** No significant movement detected.
- 2002** No significant movement detected.
- 2003** No significant movement detected.
- 2004** No significant movement detected.
- 2005** No significant movement detected.
- 2006** No significant movement detected.
- 2007** No significant movement detected.
- 2008** No significant movement detected.
- 2009** No significant movement detected.
- 2010** No significant movement detected.
- 2011** No significant movement detected.
- 2012** No significant movement detected.
- 2013** No significant movement detected.

Villa Park (Auxiliary) Dam
Horizontal Movement Along Dam Axis (Difference from Planned Stationing)

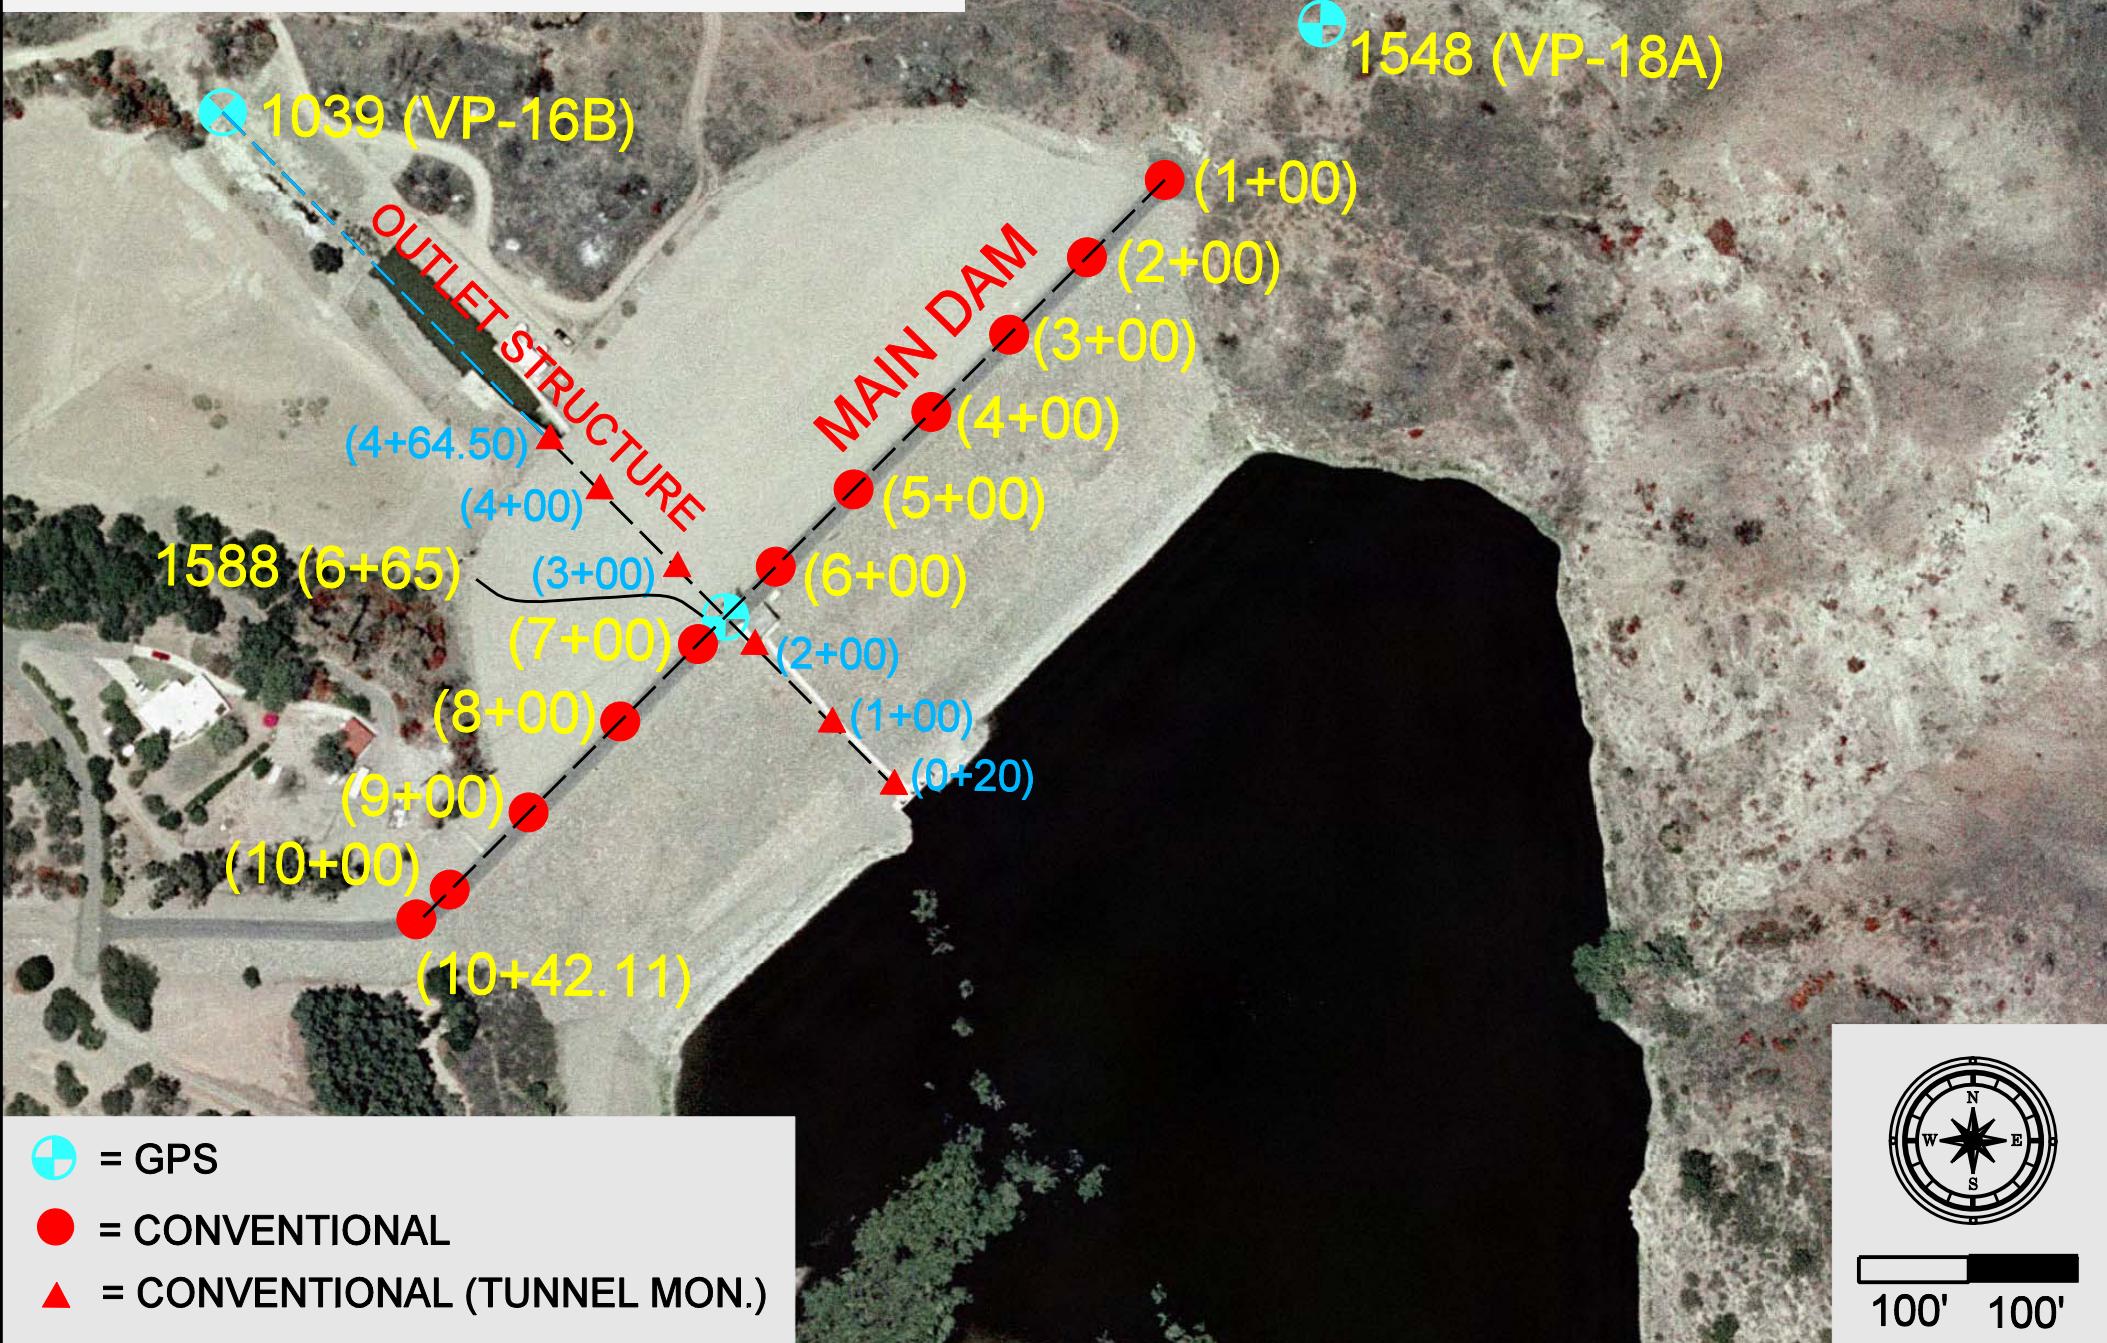

Villa Park (Auxiliary) Dam

Vertical Movement (Difference from 1980 Elevations) - Profile View - *Looking Upstream*

Villa Park (Outlet) Dam

Villa Park Dam (Outlet Structure) - Monitoring Survey

10/16/2013

The first vertical survey was performed in 1964 and the first horizontal survey in 1965. This report displays all surveys from 1964 to present. Horizontal displacement is compared to dam survey line, vertical displacement is compared to 1964 survey.

Chart Details

Horizontal Movement Perpendicular to Tunnel Axis - shows all data from each year.

Stations "VP16, VP16A, and VP16B" and "6+65" are held for **Out From Line** calculations. "VP-16B" was set in place of "VP-16A" in 2000 due to the instability of the ground around the monument. All **Out From Line** calculations will be done from "VP-16B" and "Main Dam 6+65" after 1999.

Positive numbers represent monitored stations to the right of line (northeasterly), negative numbers represent monitored stations to the left of line (southwesterly).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Control point VP-16A / VP-16B is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the elevation to the "1964 survey" elevation.

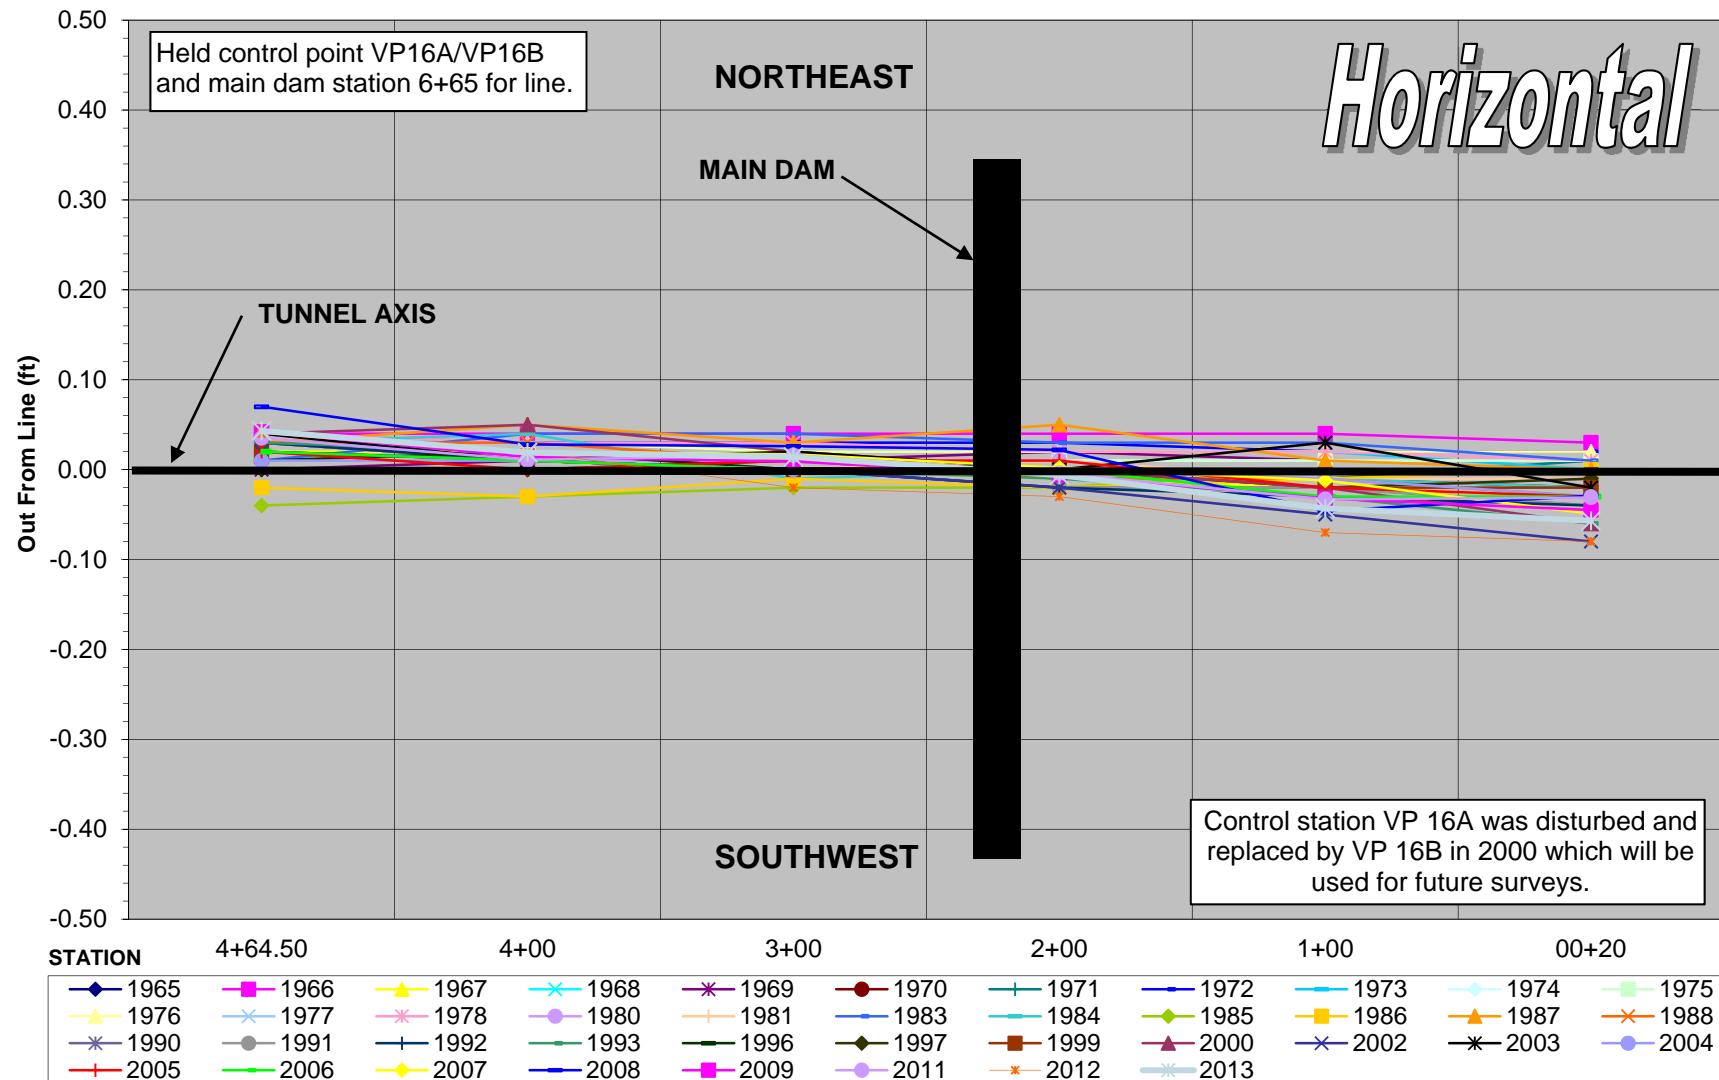

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values are shown in U.S. Feet.

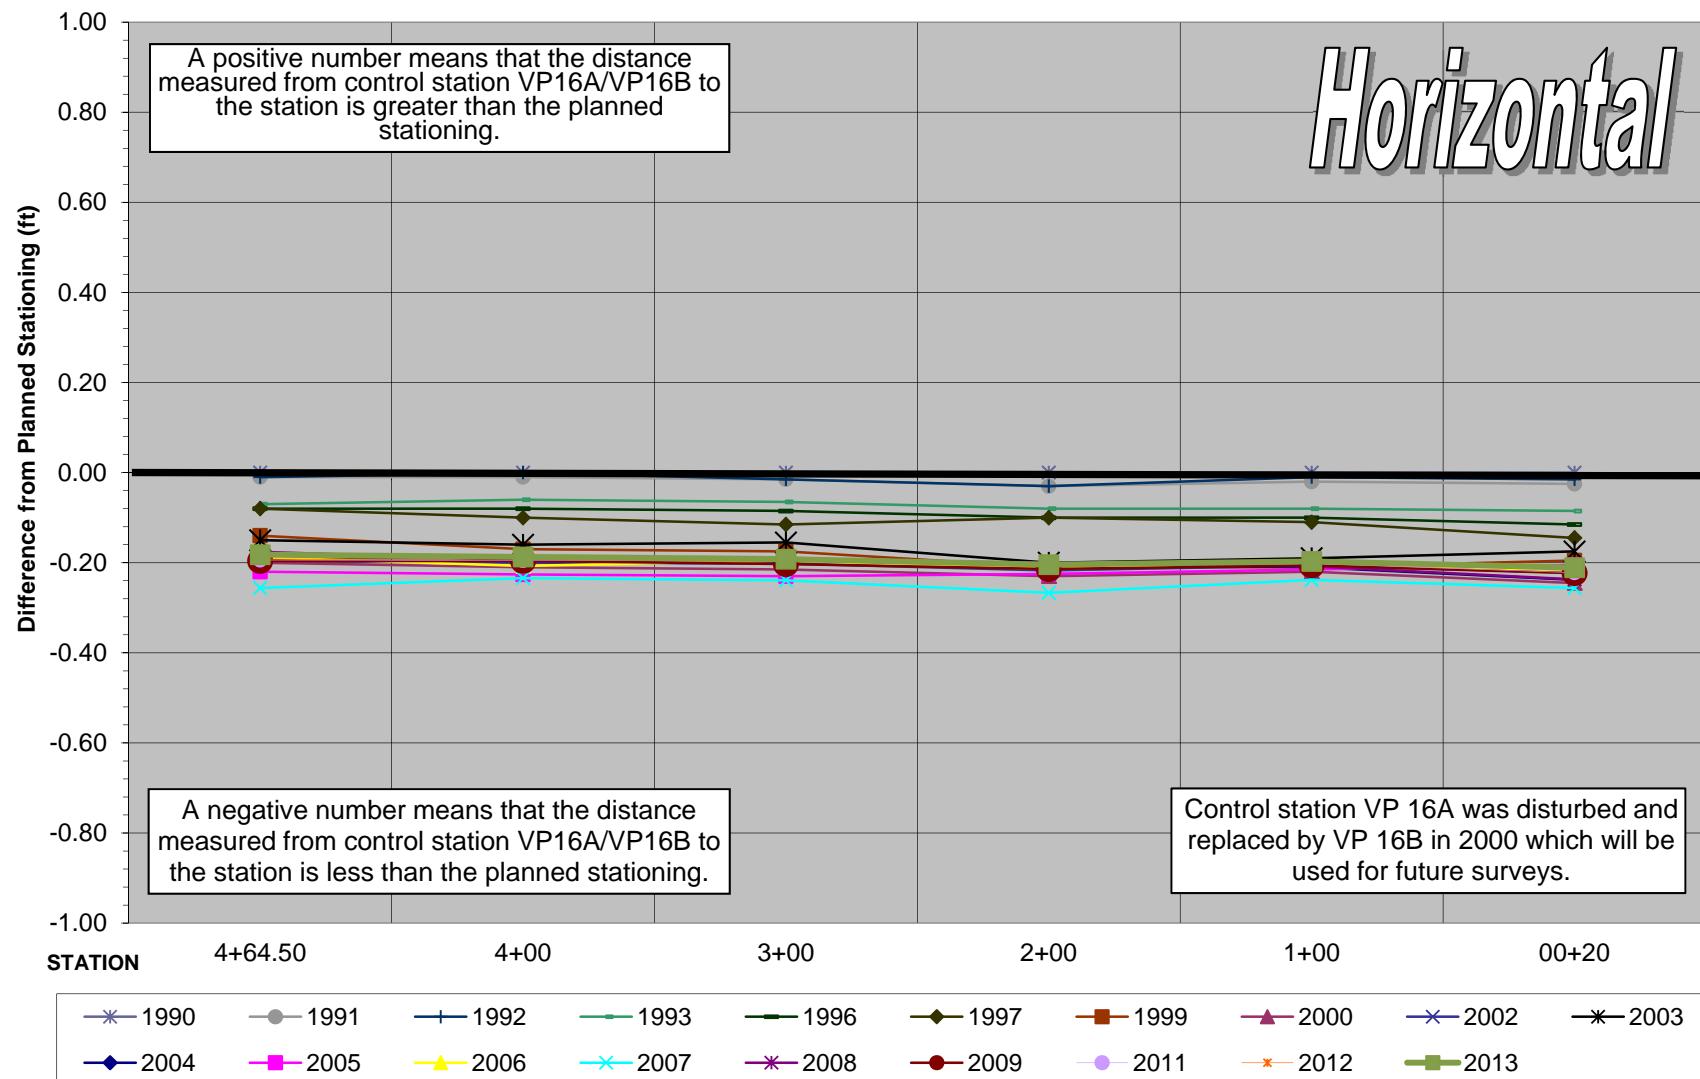

Report Summary

- 1964-1984** Horizontally stable. Vertical subsidence occurs due to settling of dam
- 1985-1999** Horizontally stable. Vertical subsidence seems to stop. No significant movement detected.
- 2000** Horizontal chart differs from previous surveys due to change in control stations. Vertical appears stable. No significant movement detected.
- 2001** No survey performed due to excessive water in tunnel.
- 2002** No significant movement detected.
- 2003** No significant movement detected.
- 2004** No significant movement detected.
- 2005** No significant movement detected.
- 2006** No significant movement detected.
- 2007** No significant movement detected.
- 2008** No significant movement detected.
- 2009** No significant movement detected.
- 2010** VP Tunnel not monitored. GPS Point #1039 (VP-16B) was underwater; point is unusable until the water is drained from this area.
- 2011** No significant movement detected.
- 2012** No significant movement detected.
- 2013** No significant movement detected.

PETERS CANYON
DAM

Peters Canyon Dam

Peters Canyon Dam (F06D01) Monitoring Survey

10/15/2013

This earthen dam was built in 1932. The first surveyed was performed in 1996 and is used as the "benchmark" for all future surveys.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Control points # 1 and # 2 are held for *Out From Line* calculations.

Positive numbers represent stations right of line (upstream), negative numbers represent stations left of line (downstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Control point # 1 is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing each elevation to the "1996 survey" elevation.

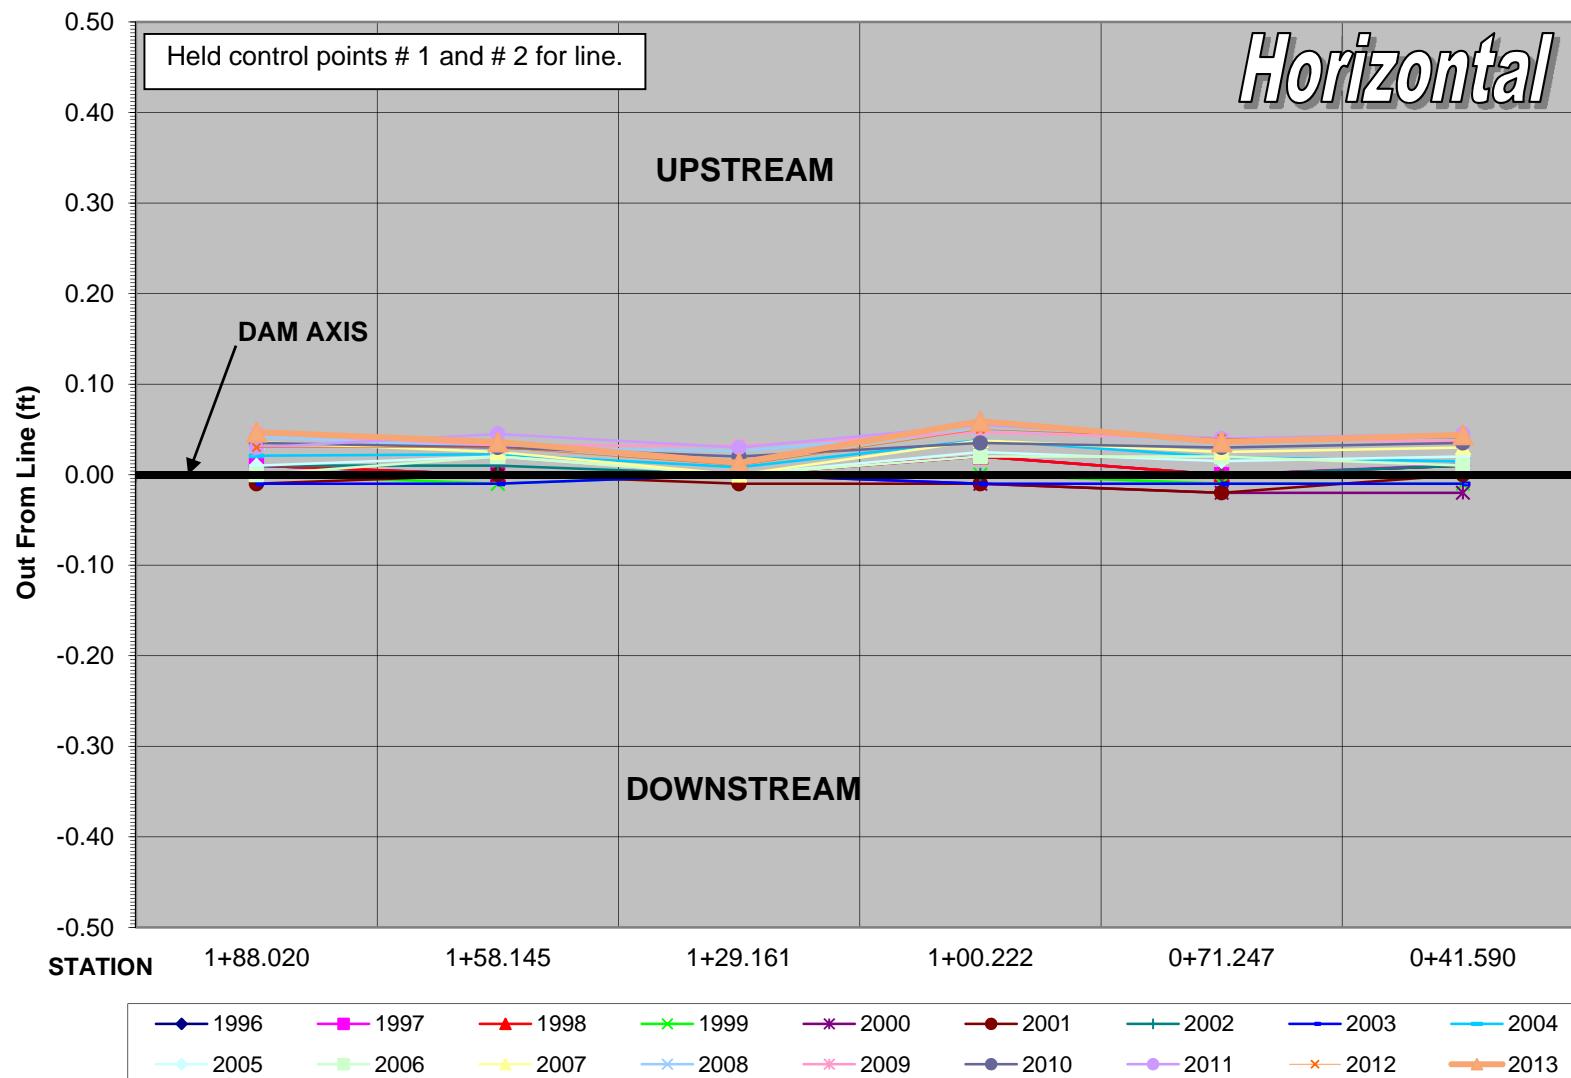

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values are shown in U.S. Survey feet. Station name is shown in meters.

Report Summary

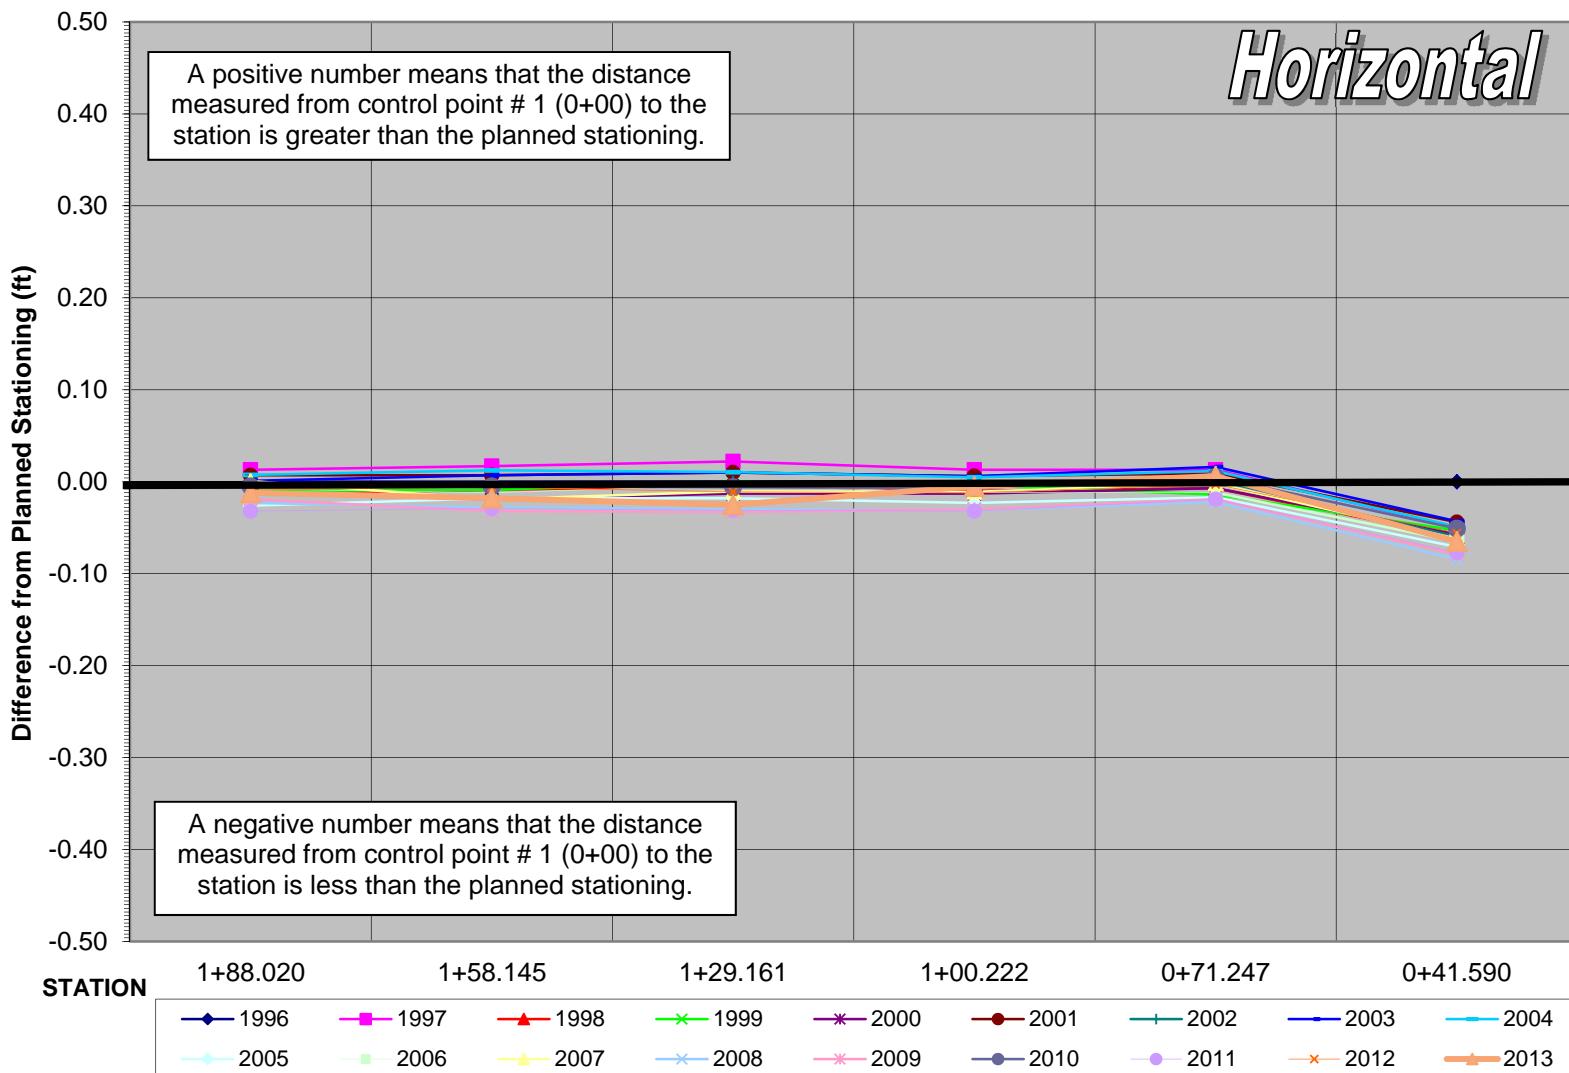

- 1996** Initial survey performed
- 1997** No significant movement detected, all monuments appear stable.
- 1998** No significant movement detected, all monuments appear stable.
- 1999** No significant movement detected, all monuments appear stable.
- 2000** No significant movement detected, all monuments appear stable.
- 2001** No significant movement detected, all monuments appear stable.
- 2002** No significant movement detected, all monuments appear stable.
- 2003** No significant movement detected, all monuments appear stable.
- 2004** No significant movement detected, all monuments appear stable.
- 2005** No significant movement detected, all monuments appear stable.
- 2006** No significant movement detected, all monuments appear stable.
- 2007** No significant movement detected, all monuments appear stable.
- 2008** No significant movement detected, all monuments appear stable.
- 2009** No significant movement detected, all monuments appear stable.
- 2010** No significant movement detected, all monuments appear stable.
- 2011** No significant movement detected, all monuments appear stable.
- 2012** No significant movement detected, all monuments appear stable.
- 2013** No significant movement detected, all monuments appear stable.

3

LOWER PETERS CANYON DAM

Lower Peters Canyon Dam

Lower Peters Canyon Dam (F06D02) Monitoring Survey

10/16/2013

Seven survey monuments were set along the top of levee in 1990. The 2004 survey will be used as the "benchmark" for all future surveys.

Chart Details

Seven monuments were three-dimensionally positioned utilizing GPS Static survey techniques. Because of the layout of the monuments, horizontal comparisons will be shown as differences in the northing and easting, instead of the station and offset method.

Vertical differences are calculated comparing the elevation to the "2004 survey" elevation.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Division, Geodetic Control Unit.

All values are shown in U.S. Survey feet.

Lower Peters Canyon Dam (F06D02) Monitoring Survey

10/16/2013

Report Summary

2004 Initial survey performed.

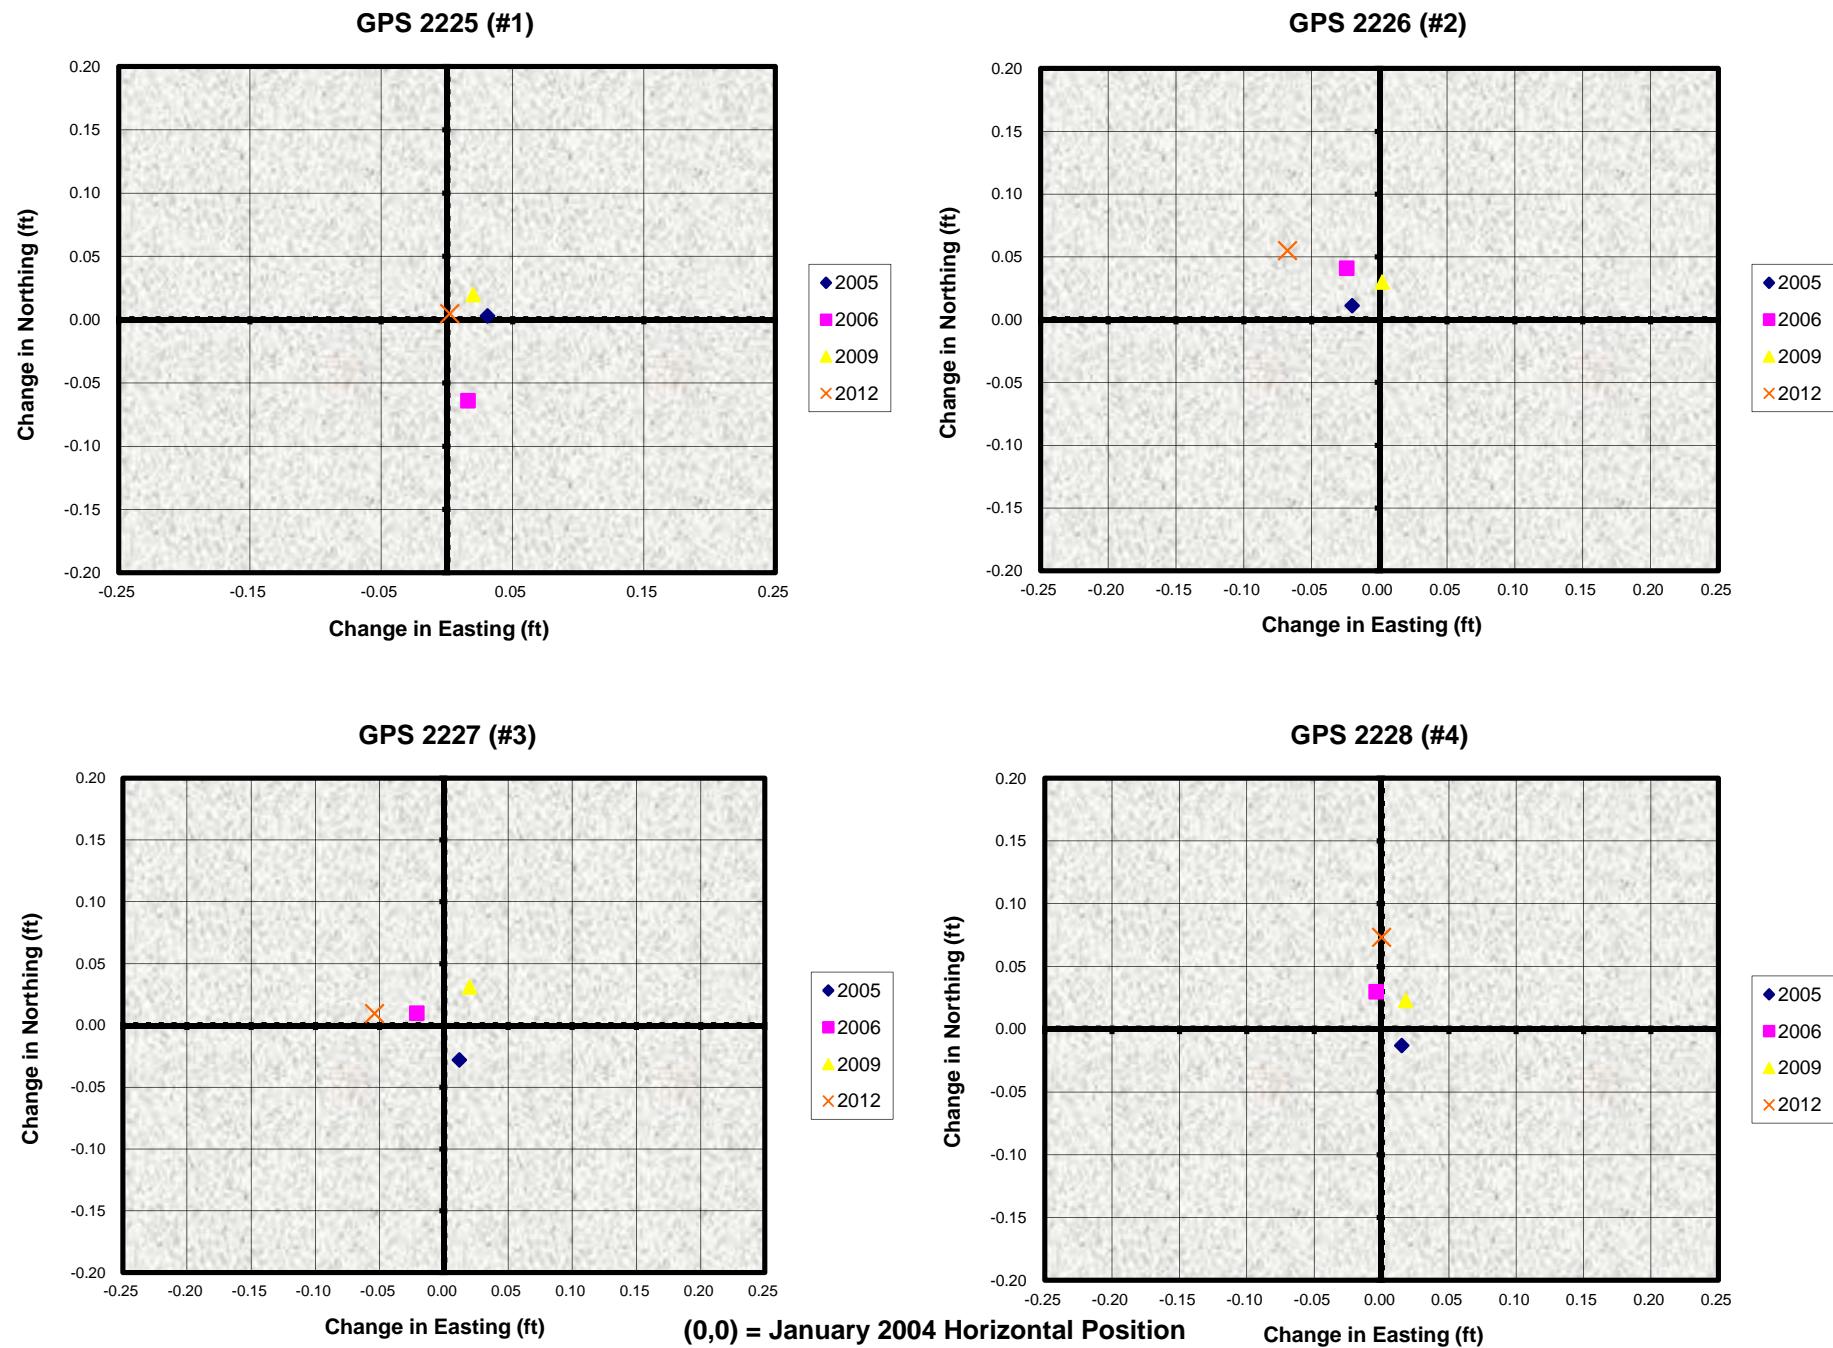

2005 No significant movement detected.

2006 No significant movement detected.

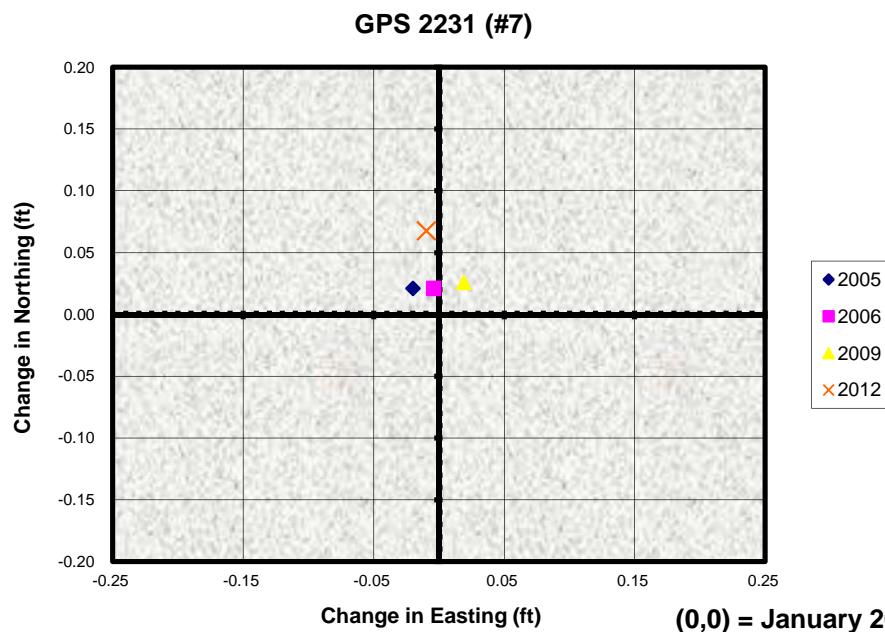

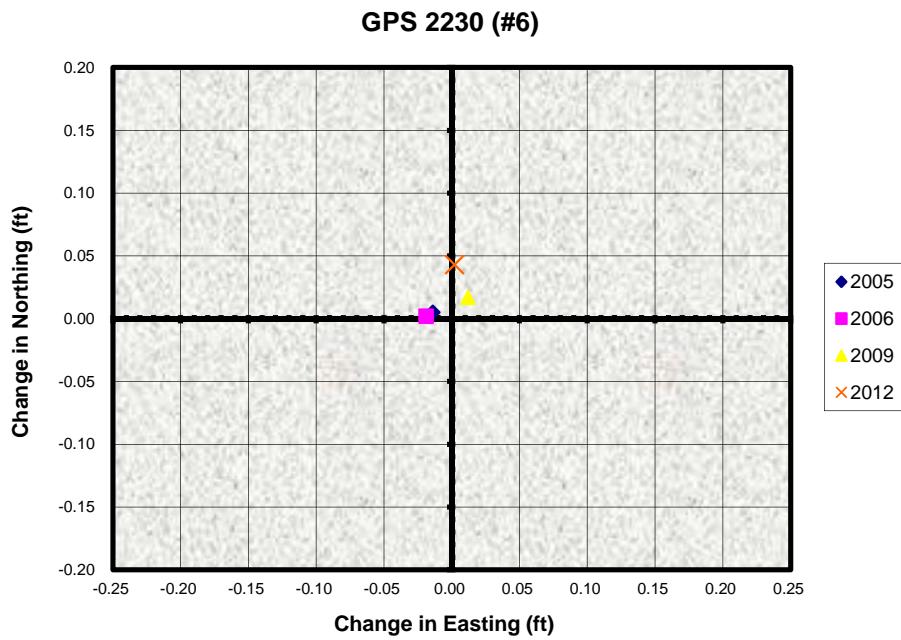

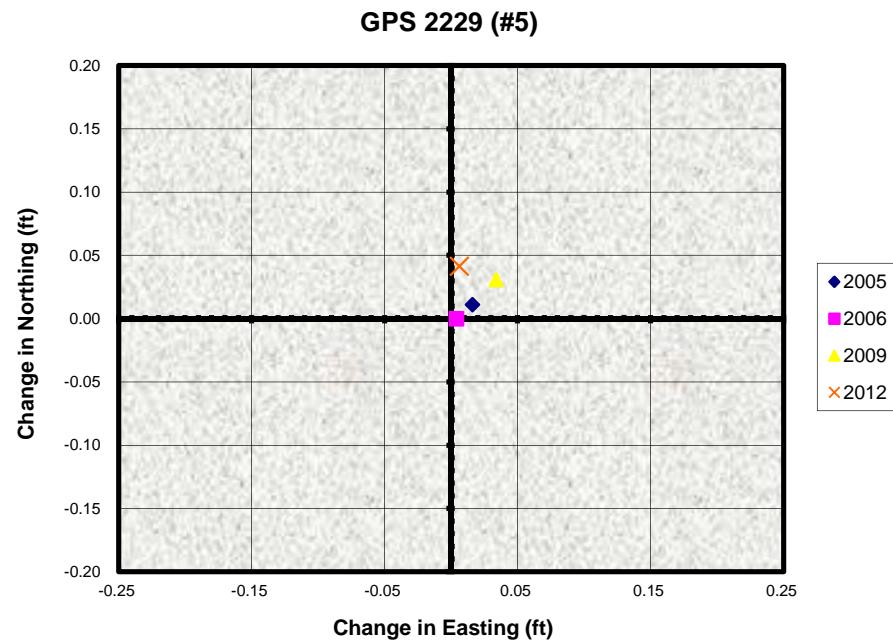

2009 No significant movement detected.

2012 No significant movement detected. There is some vertical movement of benchmarks to watch in the future.

MARSHBURN RETARDING BASIN

Marshburn Retarding Basin

Marshburn Retarding Basin (F16B01) Monitoring Survey

10/16/2013

Six survey monuments were set along the top of levee in 2001. This survey will be used as the "benchmark" for all future surveys.

Chart Details

Six monuments were three-dimensionally positioned utilizing GPS Static survey techniques. Because of the layout of the monuments, horizontal comparisons will be shown as differences in the northing and easting, instead of the station and offset method.

Vertical differences are calculated comparing the elevation to the "2001 survey" elevation.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

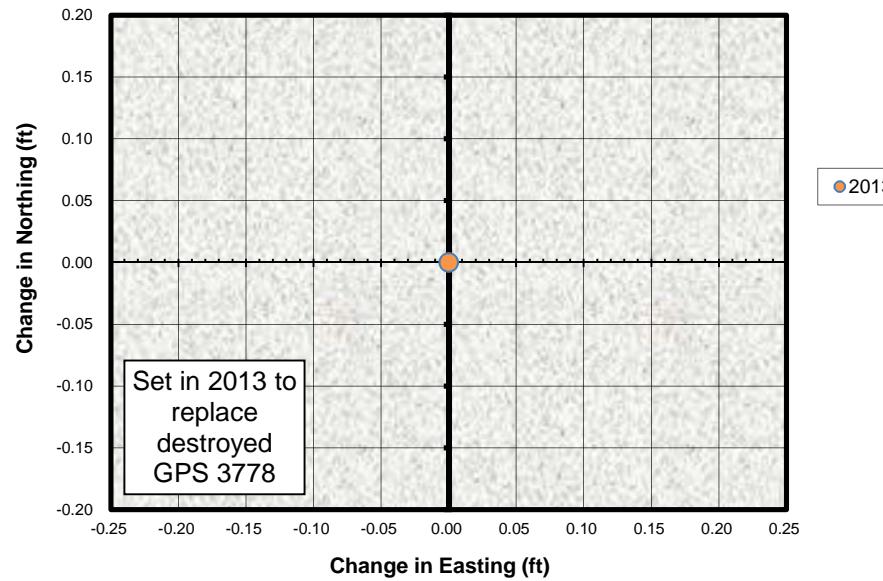

All values are shown in U.S. Survey feet.

Report Summary

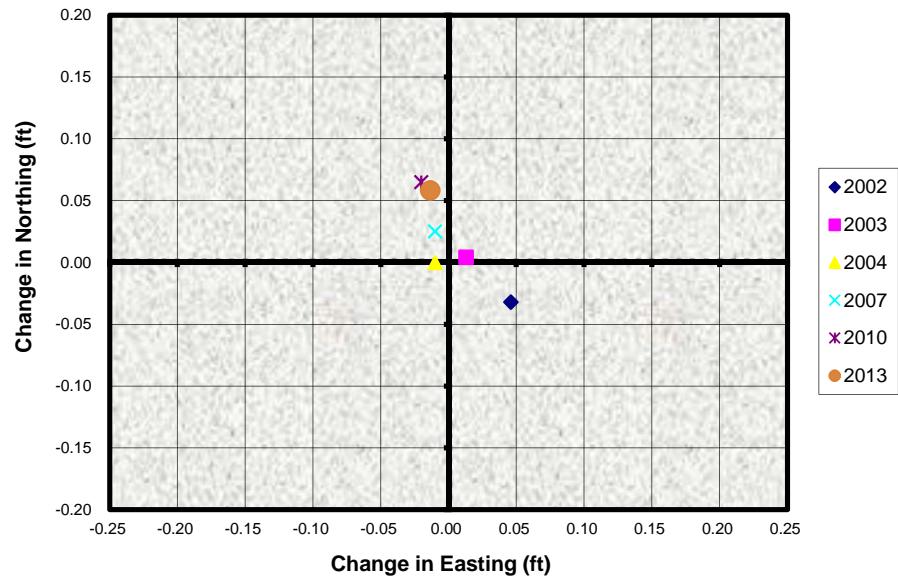

- 2001** Initial survey performed.
- 2002** No significant movement detected.
- 2003** No significant movement detected.
- 2004** No significant movement detected.
- 2007** GPS 3779, 3780 & 3781 have moved vertically -0.05' to -0.08' +/- from 2004 survey. GPS #3778 was destroyed.
- 2010** GPS 3779, 3780 & 3781 have moved vertically -0.02' +/- from 2007 survey.
- 2013** Set GPS #3766 to replace GPS #3778. No significant movement detected.

BEE CANYON RETARDING BASIN

Bee Canyon Dam

Bee Canyon Retarding Basin (F16B02) Monitoring Survey

10/15/2013

This earthen dam was built in 1995. The first surveyed was performed in 1995 and is used as the "benchmark" for all future surveys.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Stations 10+00 and 11+65 are held for *Out From Line* calculations.

Positive numbers represent stations left of line (upstream), negative numbers represent stations right of line (downstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Station 10+00 is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the elevation to the "1995 survey" elevation.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values shown are in U.S. Survey feet. Station names are in meters.

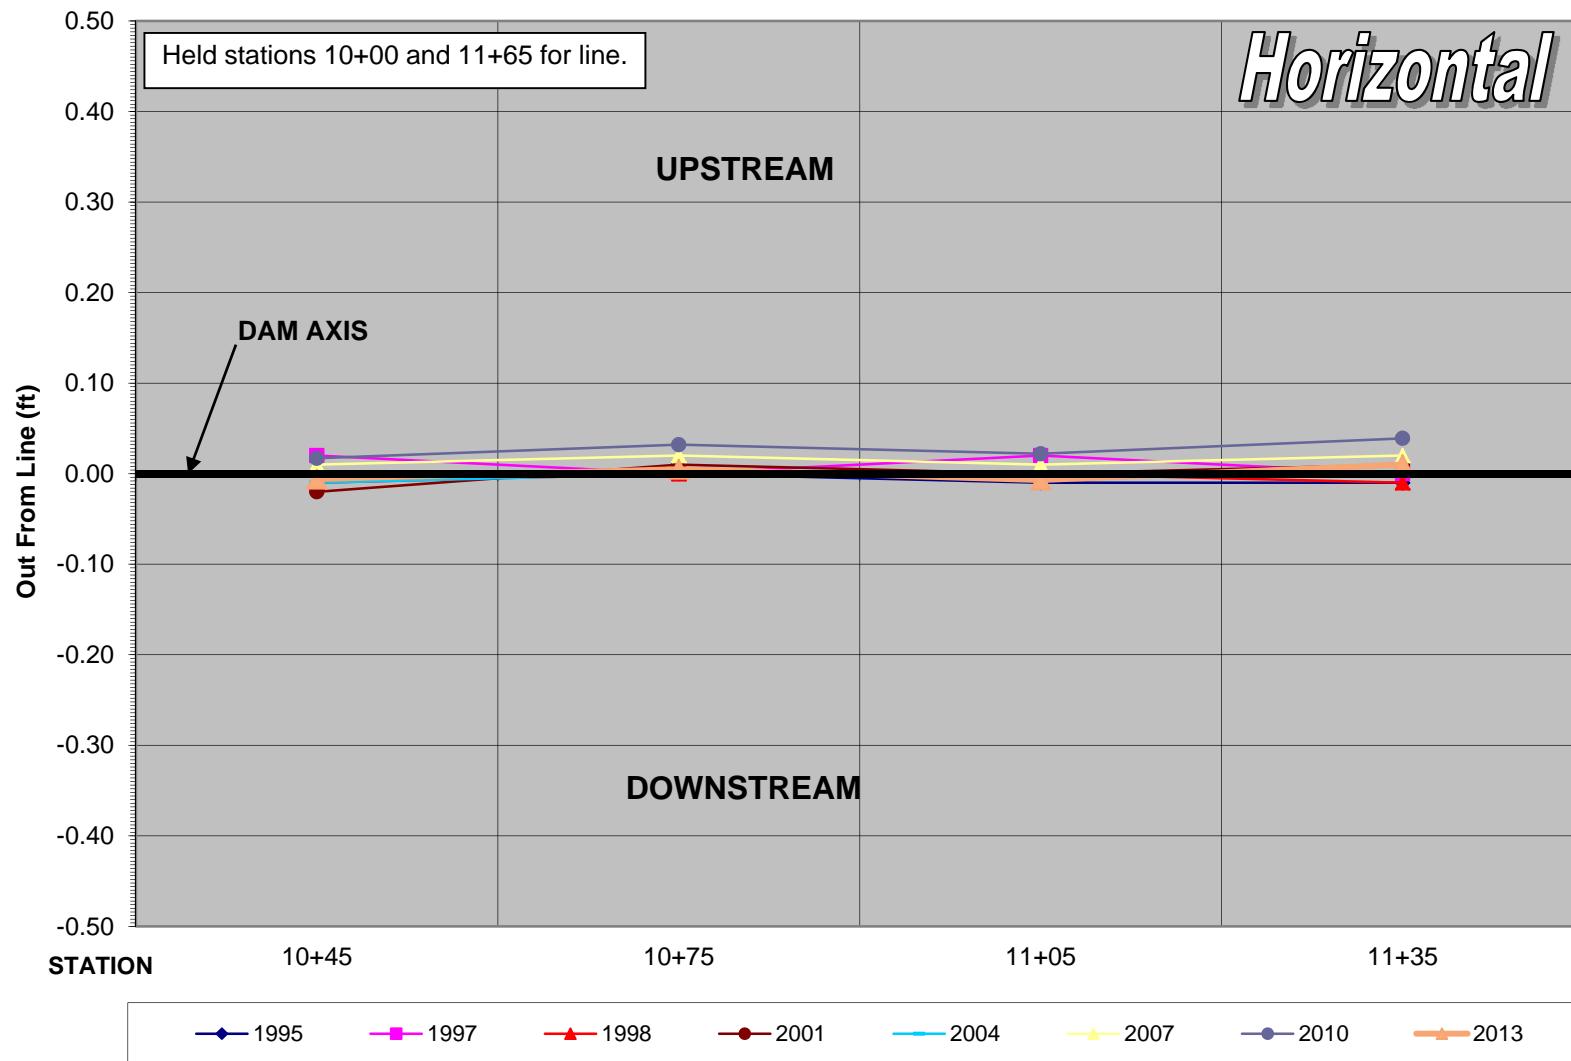

Bee Canyon Retarding Basin (F16B02) Monitoring Survey

10/15/2013

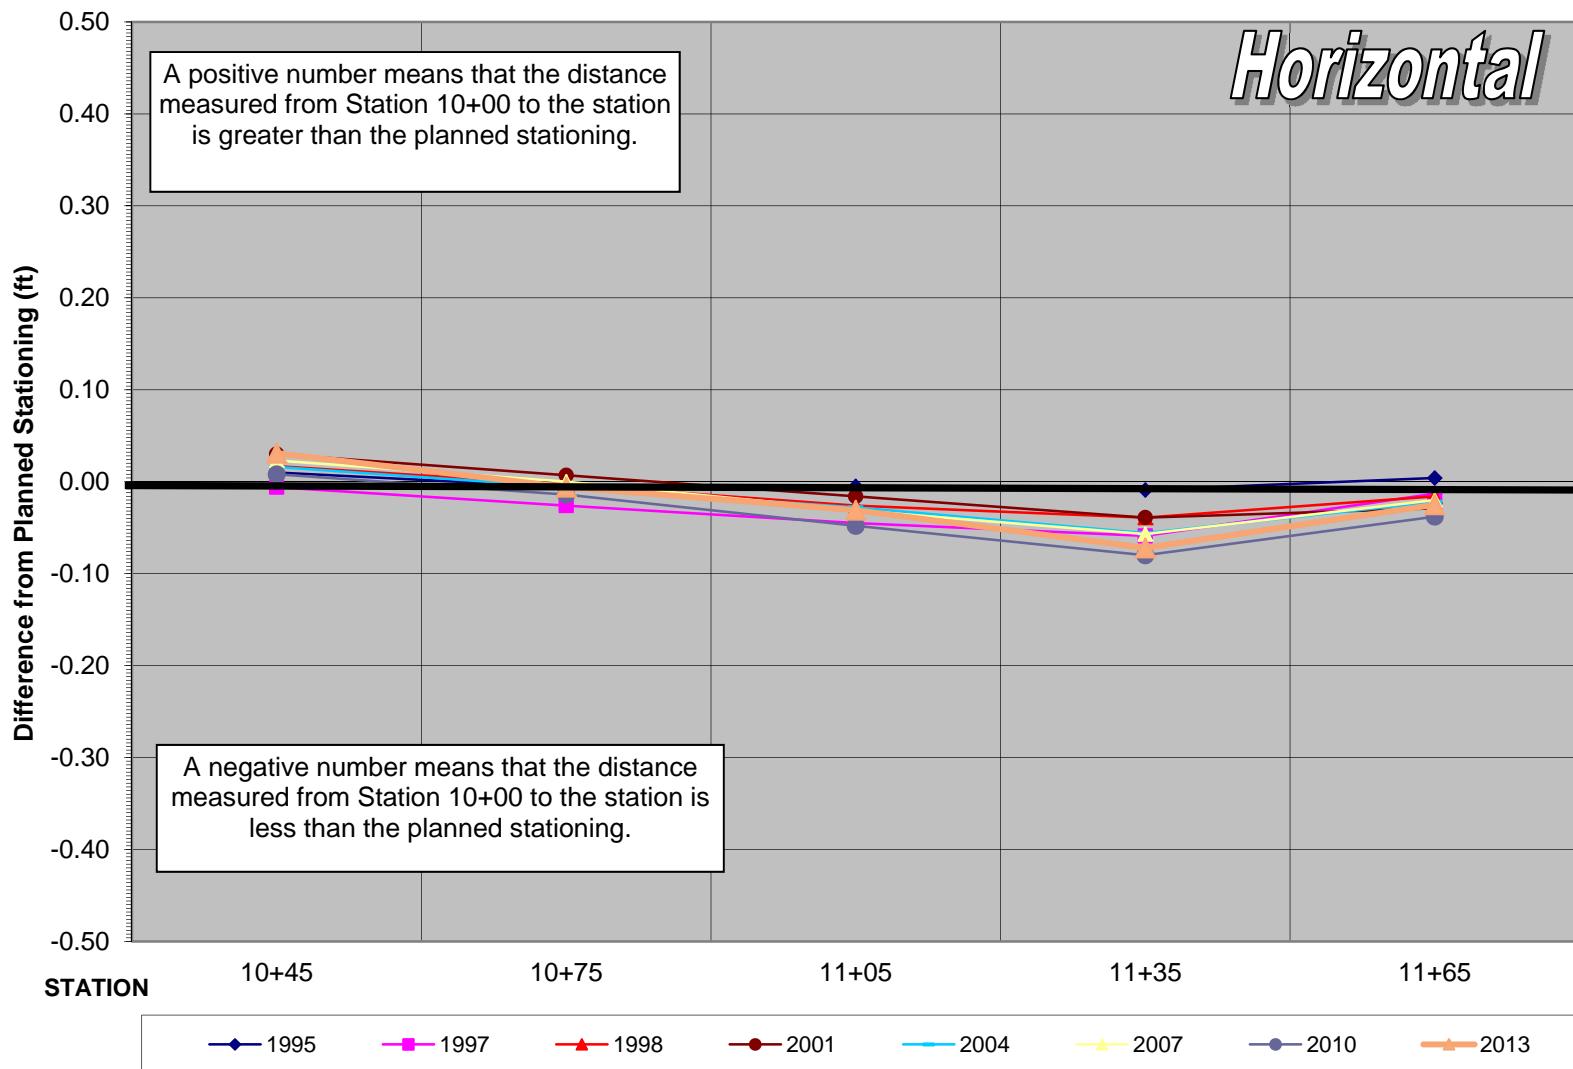

Report Summary

- 1995** Initial survey performed
- 1996** No survey performed
- 1997** Stations 10+75 and 11+05 subside approximately 0.07 feet. 11+35 subsides 0.04 feet. This could be due to settlement of the dam.
- 1998** Elevations for stations 10+75, 11+05, and 11+35 agree with the 1997 elevations within 0.01 ft. The 1997 movement seems to have stopped which was probably due to settlement of the earthen dam. Construction has been continual for the last two years for the Foothill Transportation Corridor which abutts up against the downstream side of the dam.
- 2001** No significant movement detected. Vertical subsidence trend continues.
- 2004** No significant movement detected.
- 2007** No significant movement detected.
- 2010** No significant movement detected. Corrected data errors discovered in the "Horizontal Movement Perpendicular to Dam Axis" for 2007.
- 2013** No significant movement detected.

6

ROUND CANYON RETARDING BASIN

Round Canyon Dam

Round Canyon Retarding Basin (F16B03) Monitoring Survey

10/15/2013

This earthen dam was built in 1995. The first surveyed was performed in 1995 and is used as the "benchmark" for all future surveys.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Stations 10+75 and 12+25 are held for ***Out From Line*** calculations starting 1997. The original monitoring stations were destroyed shortly after 1995 survey.

Positive numbers represent stations left of line (upstream), negative numbers represent stations right of line (downstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Station 12+25 is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the elevation to the "1995 survey" elevation.

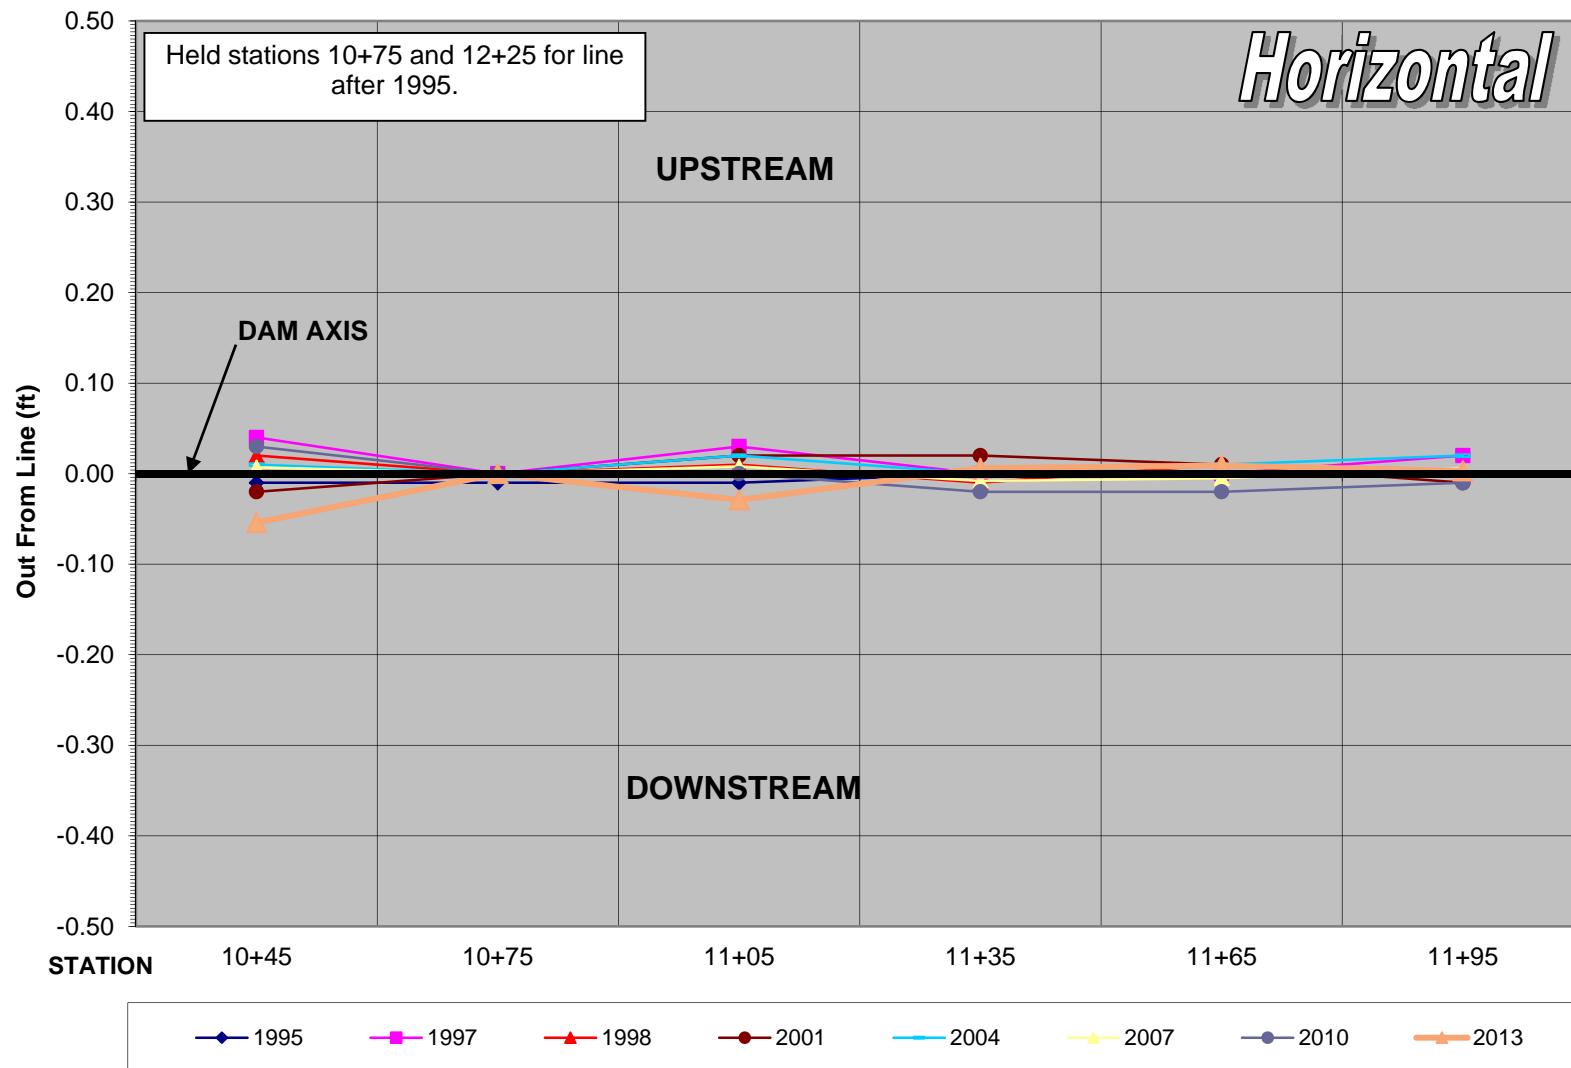

Detailed information pertaining to monument descriptions and survey information can be at OC Survey Divison, Geodetic Control Unit.

All values shown are in U.S. Survey feet. Station names are in meters.

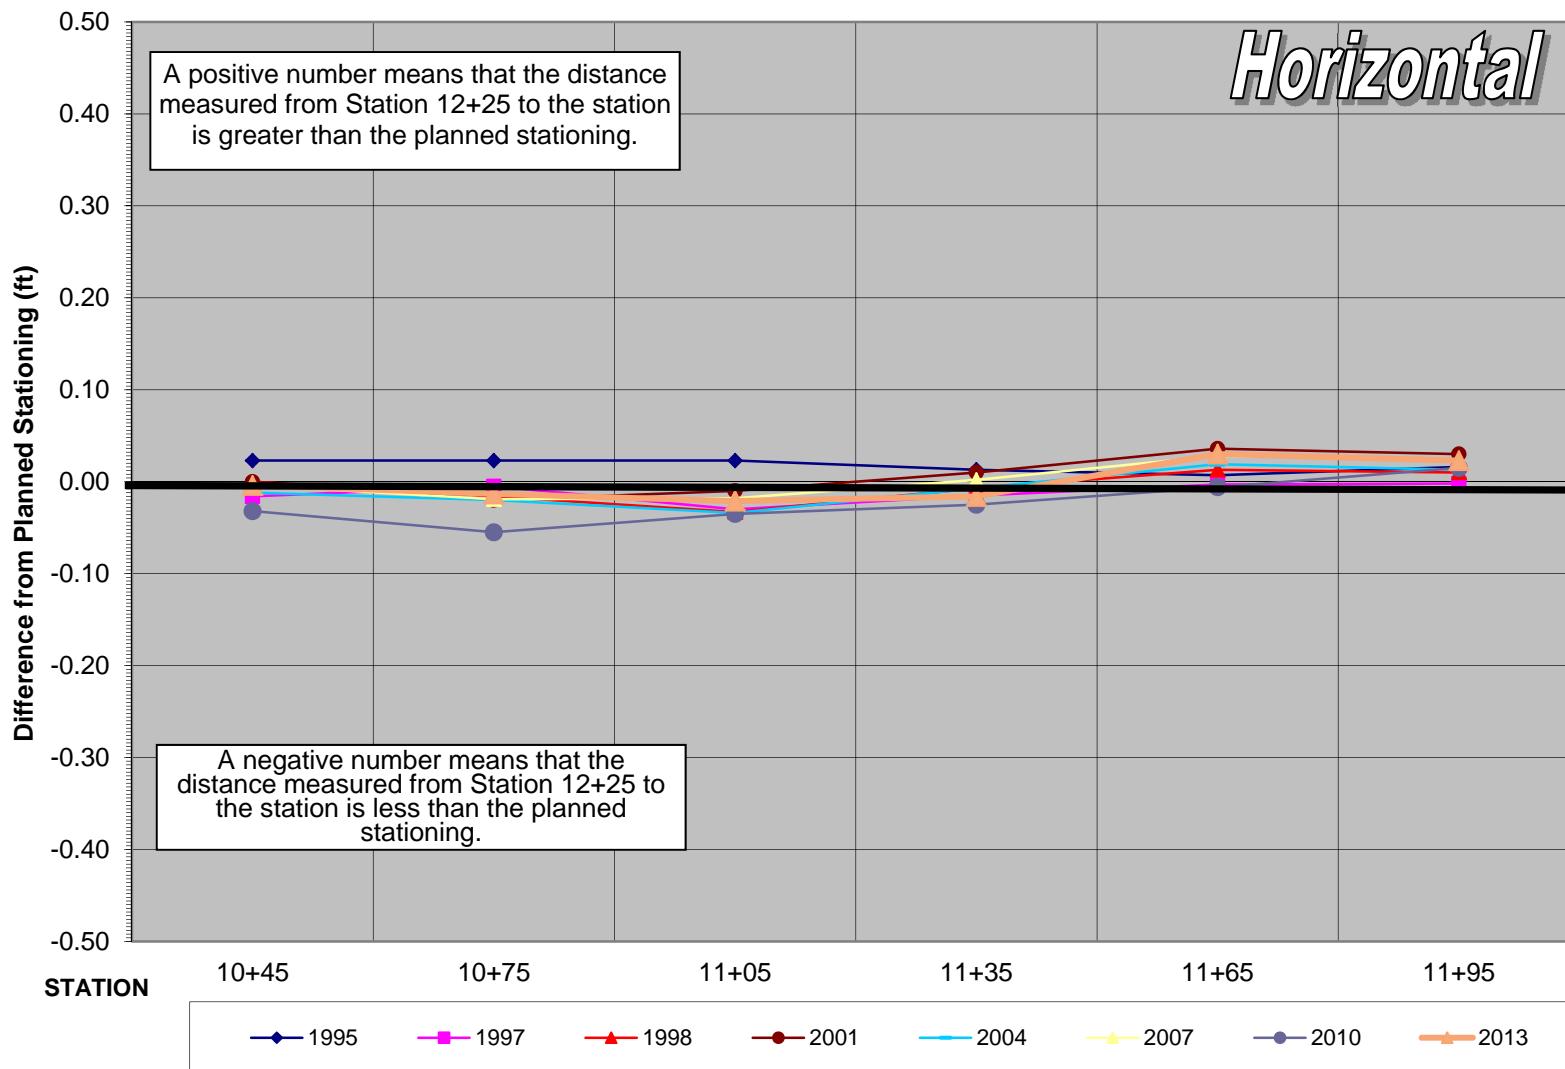

Report Summary

- 1995** Initial survey performed.
- 1996** No survey performed.
- 1997** All stations show subsidence of approximately 0.05 feet. 12+25 shows none. This is probably due to settlement of the dam. Horizontal positions seem stable.
- 1998** The same stations from the 1997 survey show a decrease in the subsidence down to approximately 0.02 feet. Horizontal positions seem stable. Construction has been continual for the last two years for the Foothill Transportation Corridor which abuts up against the downstream side of the dam.
- 2001** No significant movement detected. Vertical subsidence trend continues.
- 2004** No significant movement detected.
- 2007** No significant movement detected.
- 2010** No significant movement detected.
- 2013** No significant movement detected.

AGUA CHINON RETARDING BASIN

Agua Chinon Dam

50' 50'

Agua Chinon Retarding Basin (F18B01) Monitoring Survey

10/16/2013

This earthen dam was built and first surveyed in 1998. This survey will be used as the "benchmark" for all future surveys.

Chart Details

Four monuments were three-dimensionally positioned utilizing GPS Static survey techniques. Because of the layout of the monuments, horizontal comparisons will be shown as differences in the northing and easting, instead of the station and offset method.

Vertical differences are calculated comparing the elevation to the "1998 survey" elevation.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Division, Geodetic Control Unit.

All values are shown in U.S. Survey feet.

ORCHARD ESTATES RETARDING BASIN

Orchard Estates Retarding Basin

Orchard Estates Retarding Basin (F26B02) Monitoring Survey

10/15/2013

Seven survey monuments were set along the top of levee in 2001. This survey will be used as the "benchmark" for all future surveys.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Stations 1+00 and 10+00 are held for *Out From Line* calculations.

Positive numbers represent stations right of line (upstream), negative numbers represent stations left of line (downstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Station 1+00 is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing each elevation to the "2001 survey" elevation.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values are shown in U.S. Survey feet.

Orchard Estates Retarding Basin (F26B02) Monitoring Survey

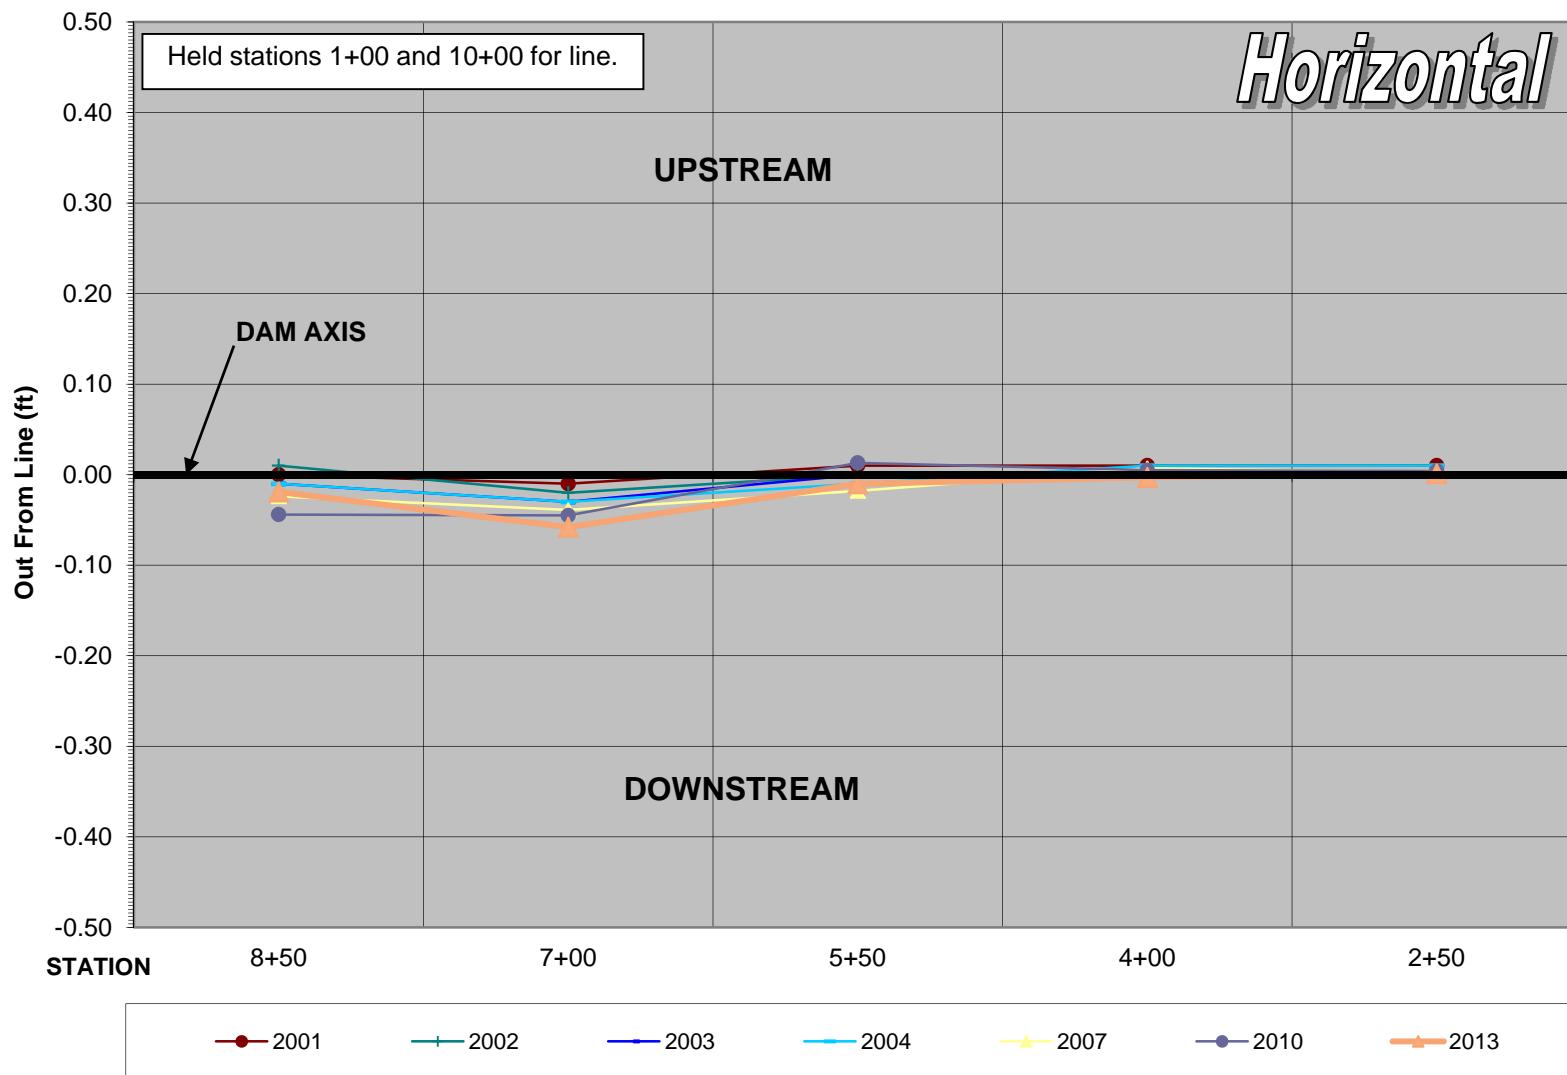

10/15/2013

Report Summary

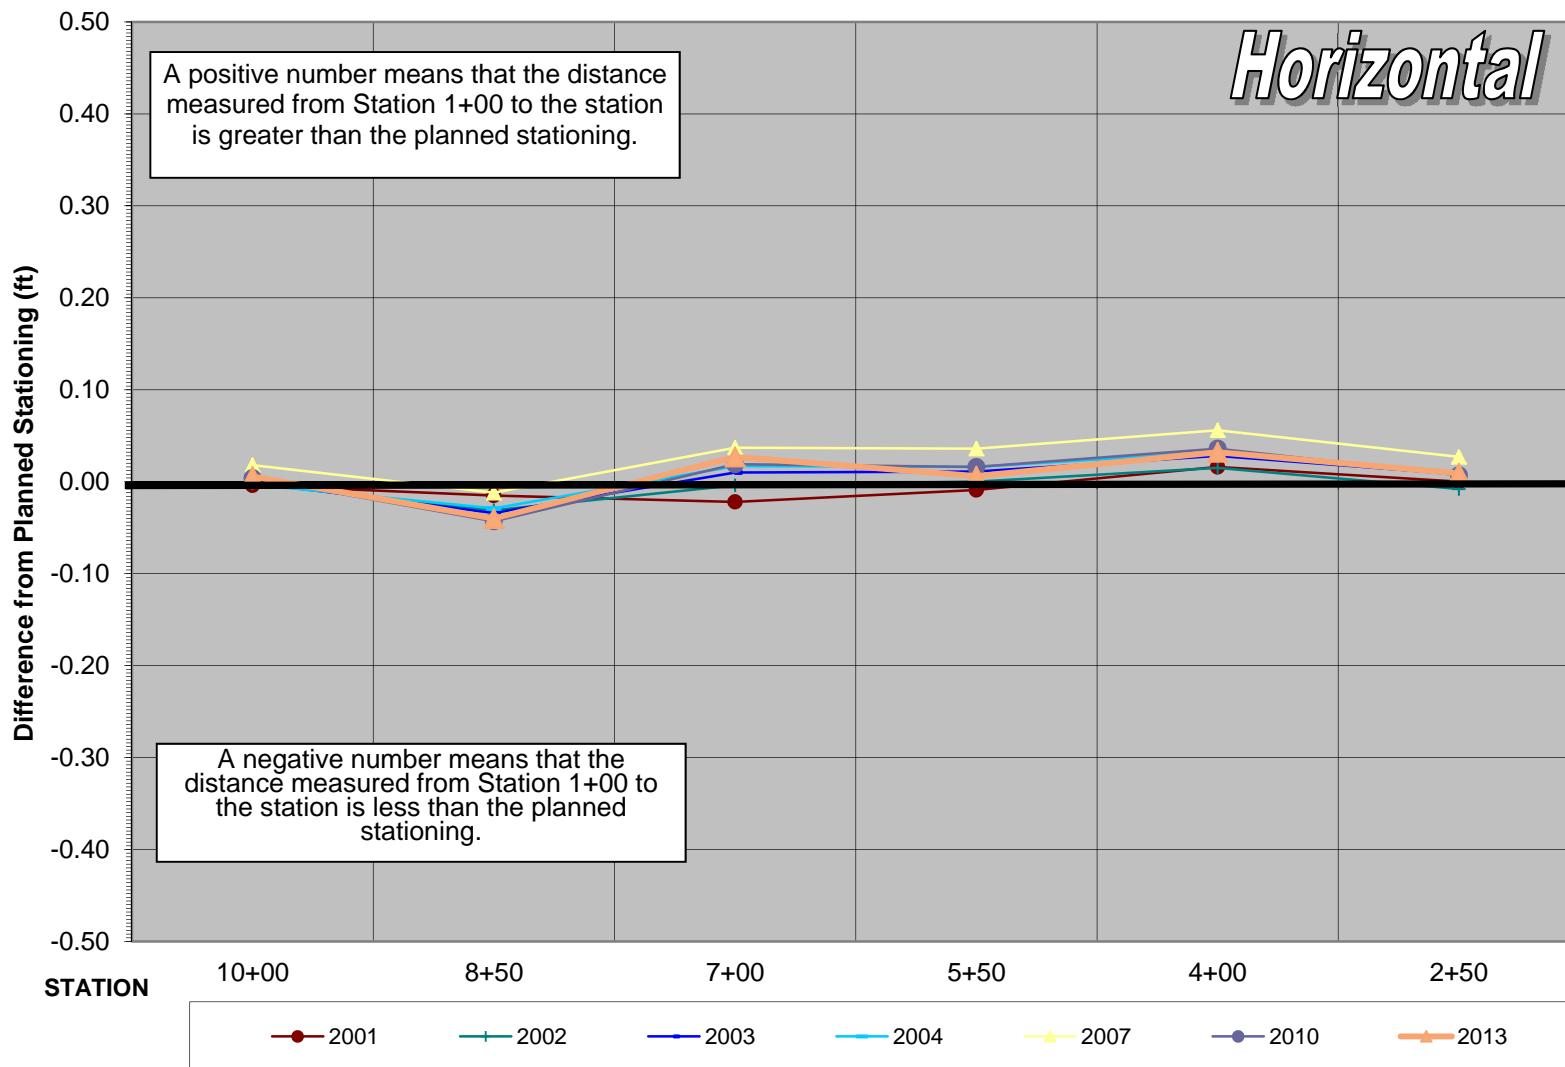

- 2001** Initial survey performed. Comparisons will begin 2002.
- 2002** No Significant Movement Detected on dam monitoring points. 2002 height of benchmark "Orchard" located on spillway headwall differs by -0.10' than 2001 height.
- 2003** Stations 7+00 and 8+50 show gradual settling.
- 2004** No Significant Movement Detected.
- 2007** No Significant Movement Detected.
- 2010** No Significant Movement Detected.
- 2013** Station 7+00 shows slight horizontal movement downstream. Stations 7+00 and 8+00 show continual vertical settling.

10

HICKS CANYON RETARDING BASIN

Hicks Canyon Dam

Hicks Canyon Retarding Basin (F27B01) Monitoring Survey

10/15/2013

This earthen dam was built in 1997. The first survey was performed in 1997 and is used as the "benchmark" for all future surveys.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Stations 6+00 and 8+00 are held for *Out From Line* calculations.

Positive numbers represent stations right of line (upstream), negative numbers represent stations left of line (downstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Station 6+00 is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the current elevation to the "1997 survey" elevation.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values shown are in U.S. Survey feet. Station names are in meters.

Hicks Canyon Retarding Basin (F27B01) Monitoring Survey

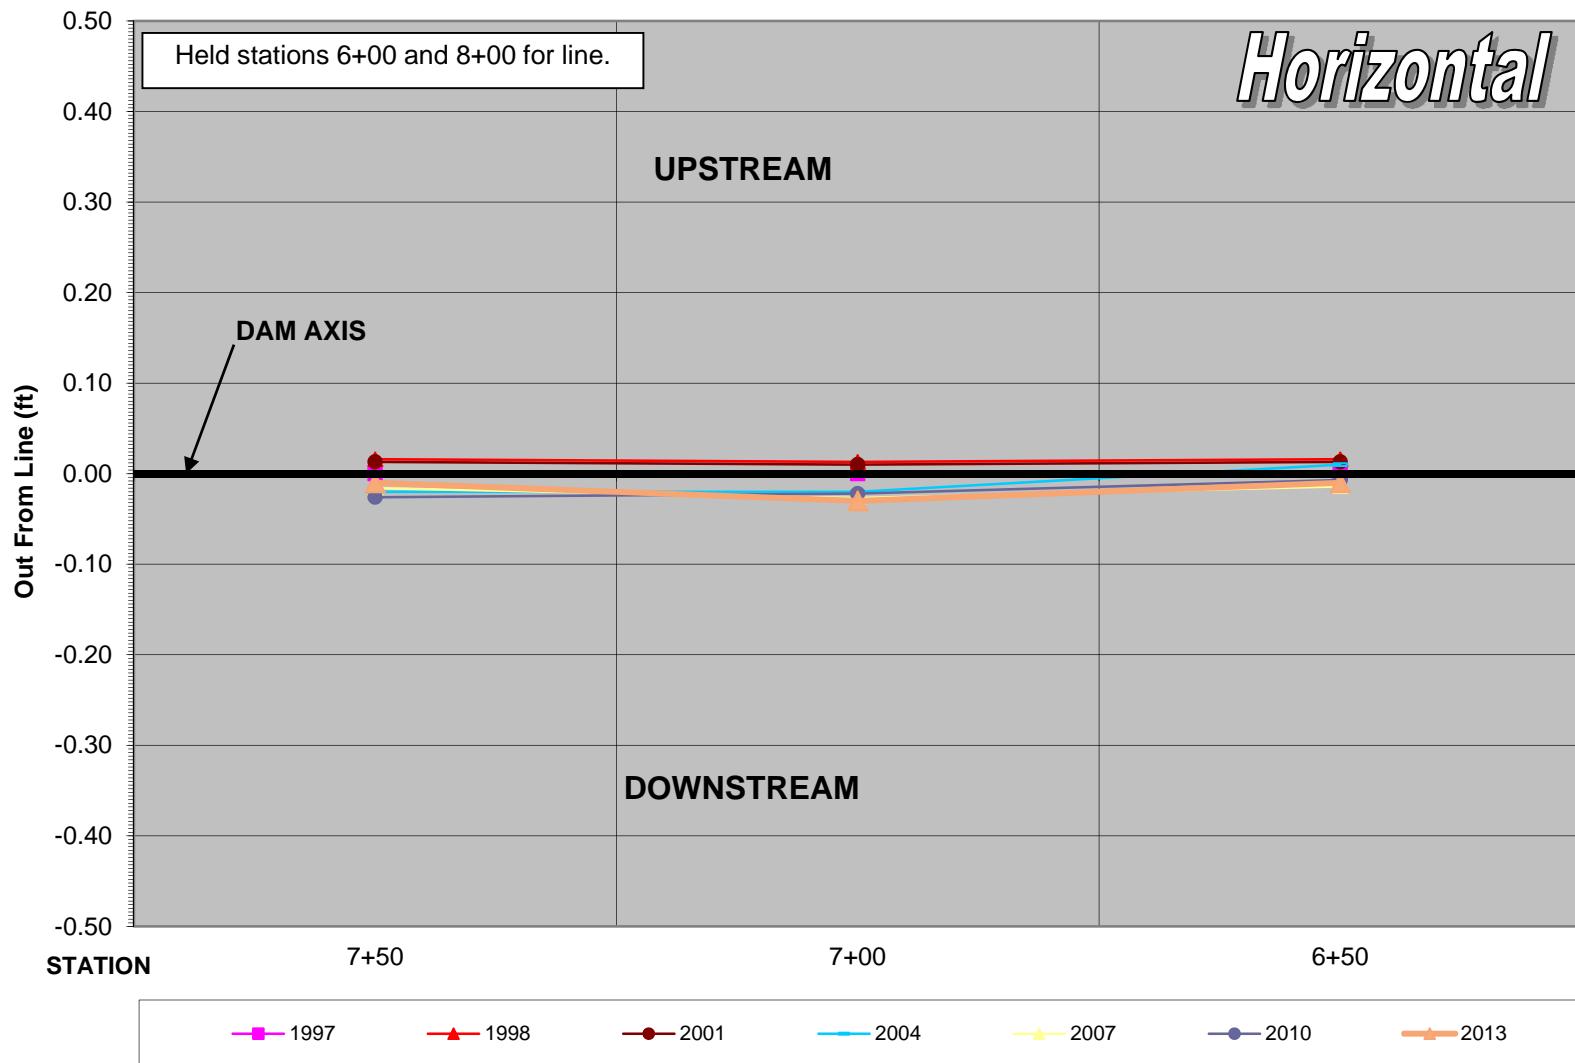

10/15/2013

Report Summary

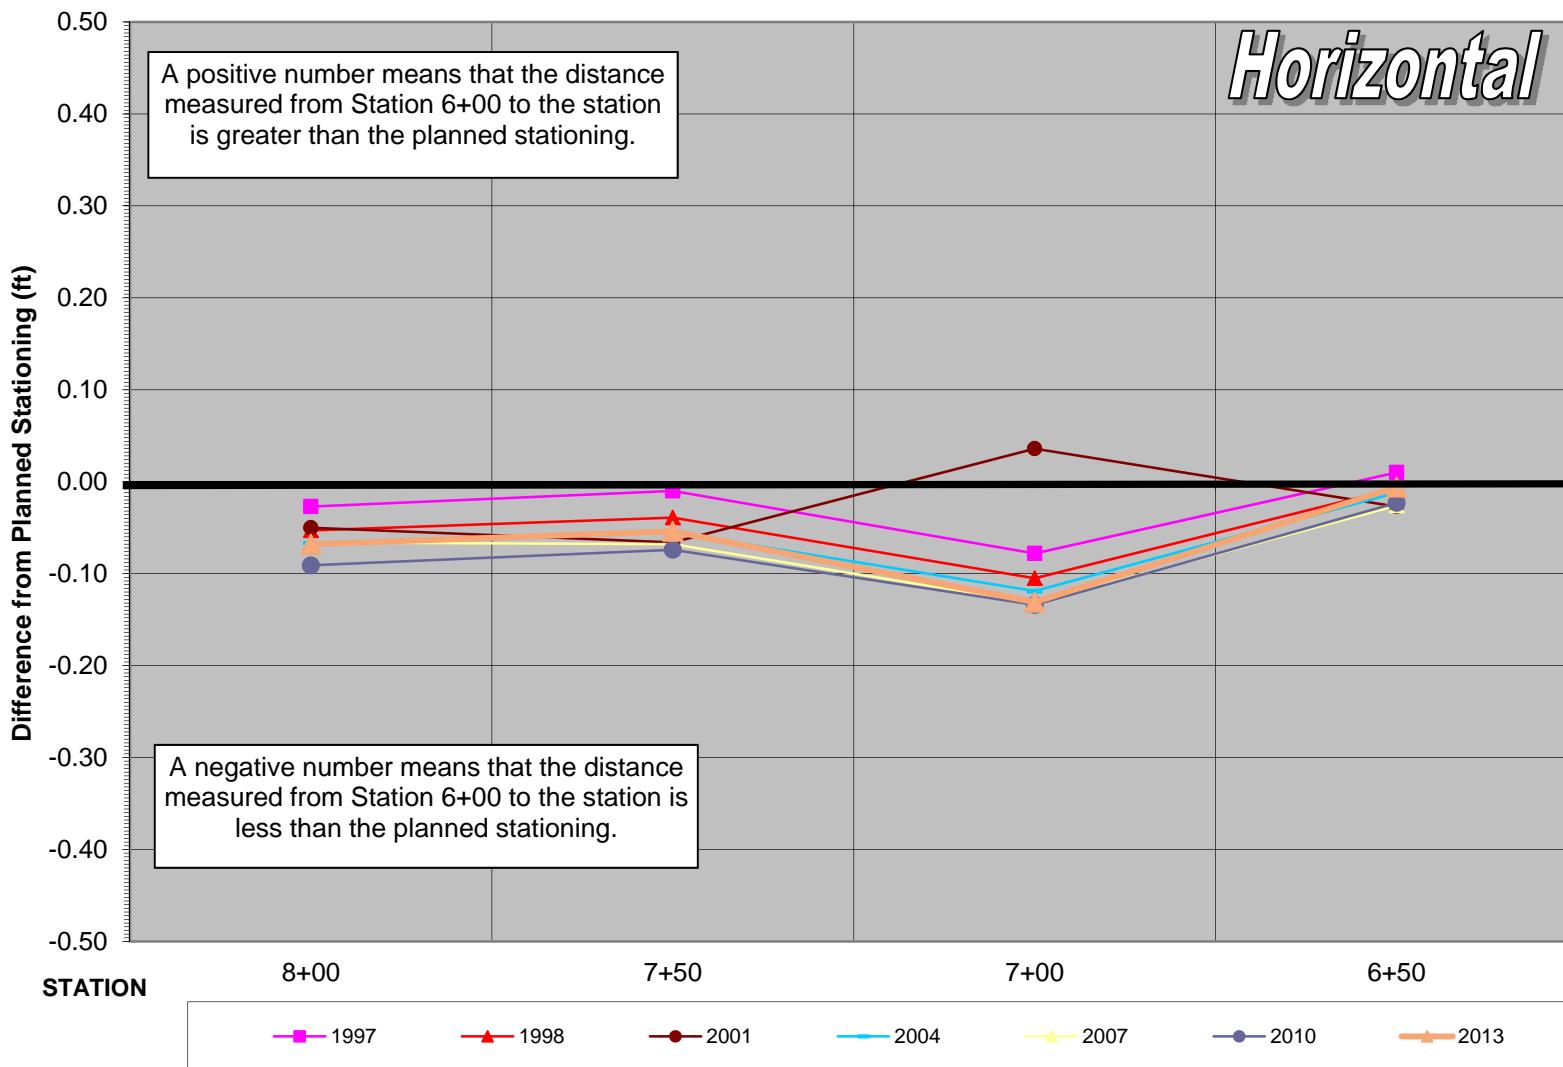

- 1997** Initial survey performed.
- 1998** All distances measured from station 6+00 differ from 0.02 to 0.03 feet. This could indicate that station 6+00 may be settling. Construction has been continual this past year for the Eastern Transportation Corridor. These differences are not significant but will be watched closely in the future.
- 2001** No significant movement. Dam monument elevations show settling trend. "Difference From Stationing" measurement for 7+00 is questionable.
- 2004** No significant movement. Difference from planned stationing are larger than expected.
- 2007** No significant movement. Difference from planned stationing are larger than expected.
- 2010** No significant movement.
- 2013** No significant movement.

EAST HICKS
CANYON
RETARDING BASIN

East Hicks Canyon Dam

East Hicks Canyon Retarding Basin (F27B02) Monitoring Survey

10/15/2013

This earthen dam was built in 1997. The first survey was performed in 1997 and is used as the "benchmark" for all future surveys.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Stations 1+00 and 4+50 are held for *Out From Line* calculations.

Positive numbers represent stations right of line (upstream), negative numbers represent stations left of line (downstream).

Horizontal Movement Along Dam Axis (difference from planned stationing) - shows all data from each year.

Station 1+00 is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than planned stationing, negative number means less than planned stationing.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the current elevation to the "1997 survey" elevation.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

All values shown are in U.S. Survey feet. Station names are in meters.

East Hicks Canyon Retarding Basin (F27B02) Monitoring Survey

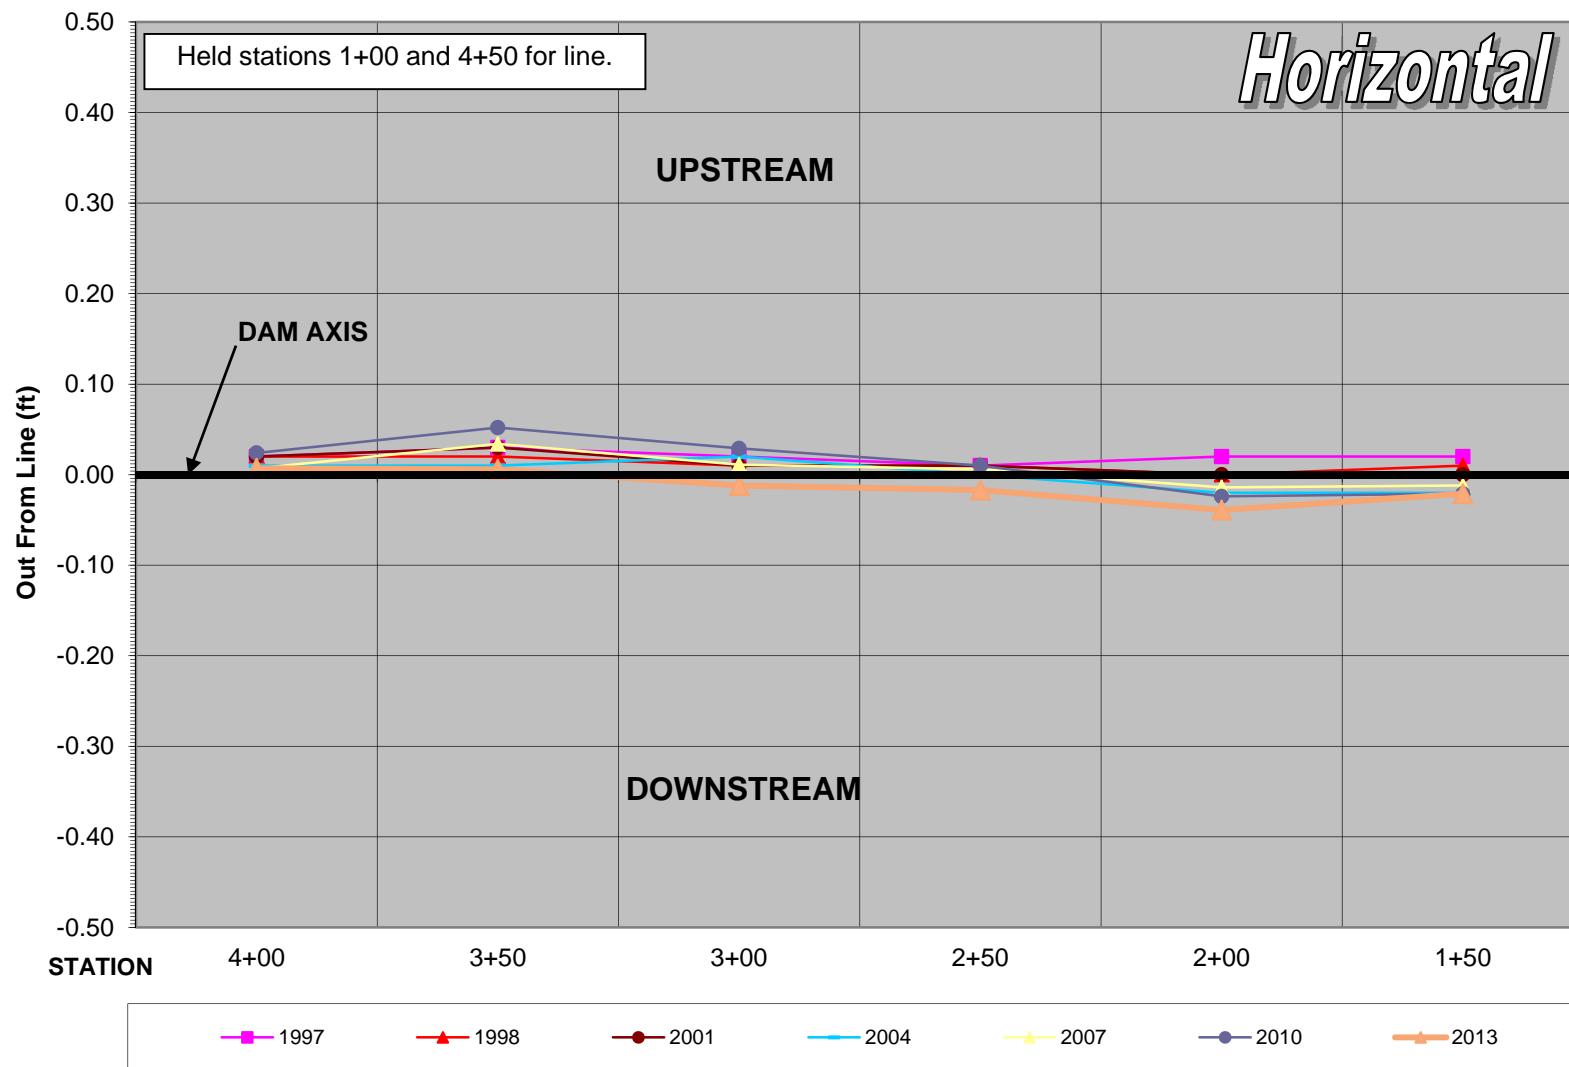

10/15/2013

Report Summary

- 1997** Initial survey performed.
- 1998** Most stations show subsidence with an average of 0.02 feet. This could be due to settlement of the dam. Horizontal positions seem stable. Construction has been continual for the last two years for the Eastern Transportation Corridor which abuts up against the downstream side of the dam.
- 2001** No significant movement detected.
- 2004** Nov-2003, The lids have been scraped off and the last monument may have been disturbed. No significant movement detected.
- 2007** Elevations appear to have a systematic difference of +0.03'. No horizontal significant movement detected.
- 2010** No significant movement detected.
- 2013** All well lids are missing and well monuments appear to have been disturbed from heavy equipment scrapping the asphalt surface. Monuments appear stable horizontally but 3+00 has sank 0.05'.

12

SULPHUR CREEK DAM

Sulphur Creek Dam

Sulphur Creek Dam (J03D01) Monitoring Survey

10/15/2013

This earthen dam was built in 1966. The first vertical monitoring survey was performed in 1979. The first horizontal survey was performed in 1981.

Horizontal displacement is compared to dam survey line. Vertical displacement is compared to 1968 elevations from 1984 Subsidence Report.

Chart Details

Horizontal Movement Perpendicular to Dam Axis - shows all data from each year.

Control points "SC-1" and "SC-2" are held for **Out From Line** calculations until 1993. In 1993, "SC-2" was found disturbed and replaced by "C-7" for line. Negative numbers represent stations right of line (downstream), positive numbers represent stations left of line (upstream).

Horizontal Movement Along Dam Axis (difference from 1985 survey) - shows all data from each year.

GPS 0249 (SC-1) Control point is held for stationing calculations.

Positive numbers mean that the distances measured to each station are greater than 1985 survey, negative number means less than 1985 survey.

Vertical Movement - shows all data from each year.

Vertical differences are calculated comparing the elevation to the "1968 survey" elevation.

Control Checks - shows all data from each year.

Horizontal movement of control stations in a cardinal direction relative to the initial 1995 GPS survey.

Detailed information pertaining to monument descriptions and survey information can be found at OC Survey Divison, Geodetic Control Unit.

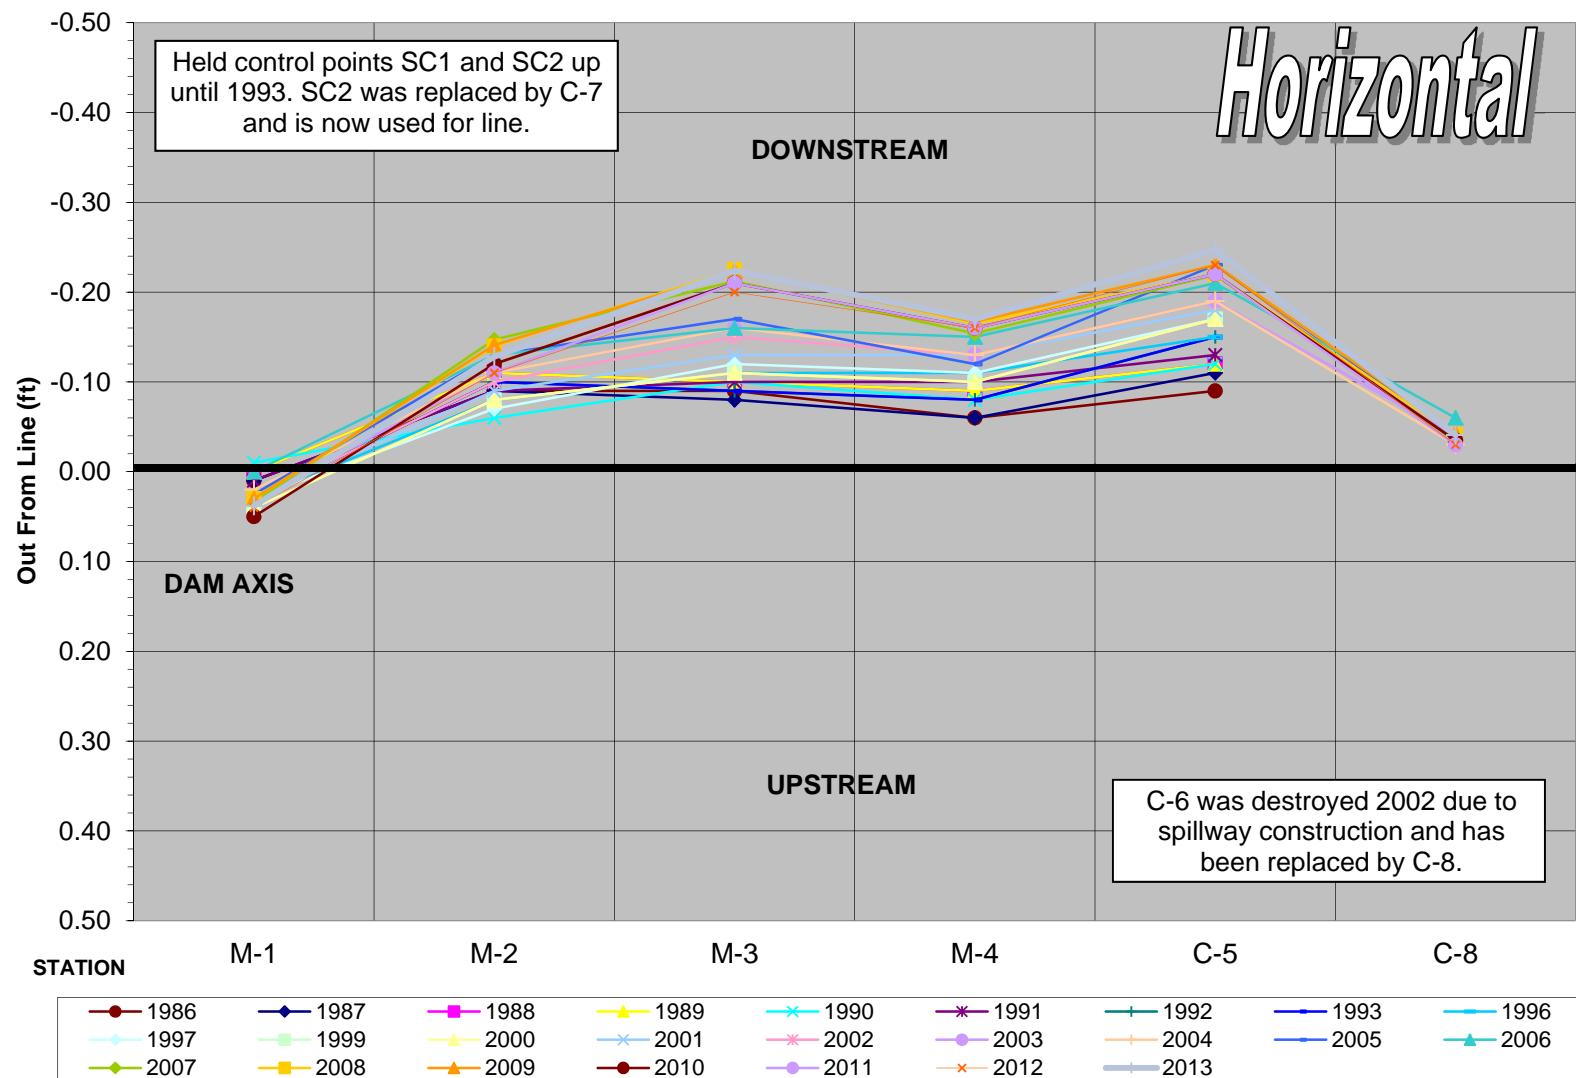

All values are shown in U.S. Survey feet.

Report Summary

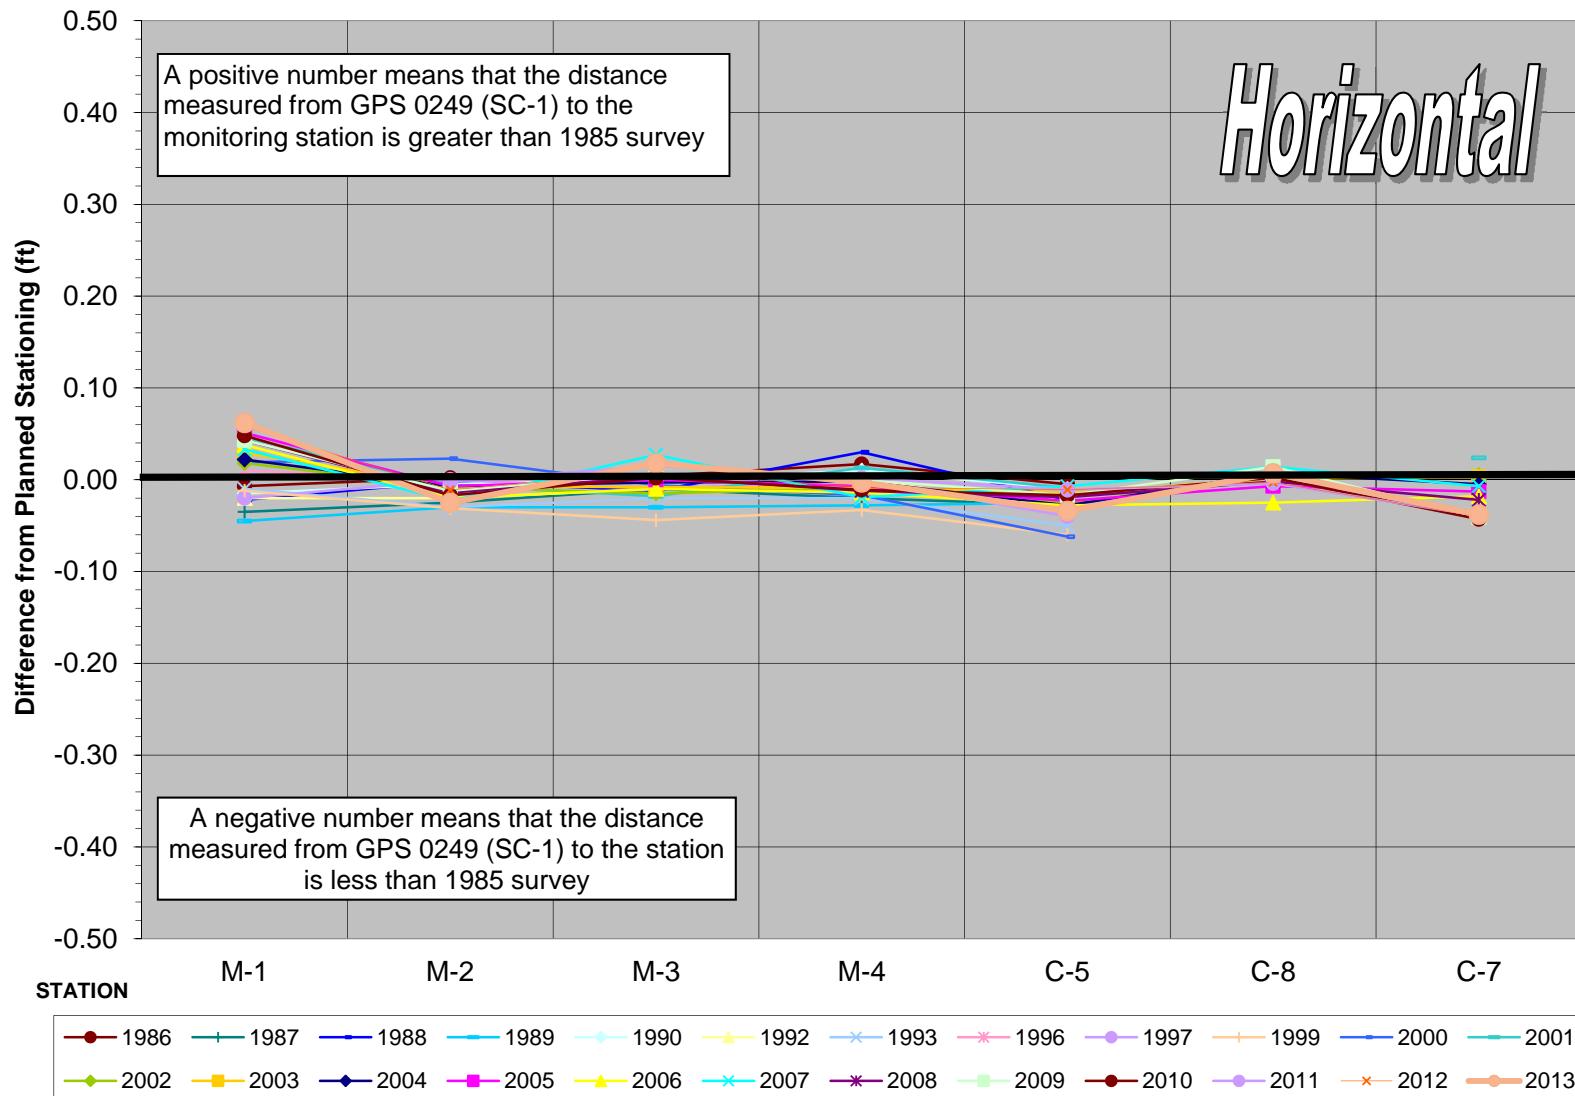

- 1981-1990** Downstream horizontal movement measured on all stations located on top of dam. Vertical uplift is found on all stations.
- 1990-2000** Downstream horizontal movement continues with the greatest amount at station C-5. Vertical uplift also continues with the greatest amount at both end stations, M-1 and C-7.
- 2001** Same horizontal and vertical trends continue
- 2002** Same horizontal trend continues. Vertical appears stable. C-6 was destroyed due to spillway construction and has been replaced by C-8.
- 2003** Same horizontal trend continues. Vertical appears stable.
- 2004** No significant movement found.
- 2005** C-5 shows downstream horizontal movement. Vertical uplift also continues with the greatest amount at both end stations, M-1 and C-7.
- 2006** All stations except M-3 show vertical uplift. M-3 shows settling.
- 2007** M-3 shows vertical settlement for past 7 years.
- 2008** M-3 continues to settle, all other monuments show uplift with the greatest amount on M-1 and C-7. All stations show slight downstream movement.
- 2009** M-3 continues to settle, all other monuments show uplift with the greatest amount on M-1 and C-7. All stations show slight downstream movement.
- 2010** M-3 appears to have vertically stabilized. C-7 shows horizontal movement in a southwest direction based on "Control Checks" chart.
- 2011** C-7 shows horizontal movement in a southwest direction based on "Control Checks" chart.
- 2012** No significant movement found.
- 2013** No significant movement found.

Note: "Out From Line" chart shows that stations have moved downstream. This may not actually be movement on the dam but due to the instability of control station C-7.

COVE ROAD
CRIB WALL

Survey Report Summary

August 1997: Initial survey performed.

November 1998: No significant movement found.

May 1999: No significant movement found.

May 2000: No significant movement found.

May 2001: No significant movement found.

July 2002: No significant movement found.

June 2004: No significant movement found.

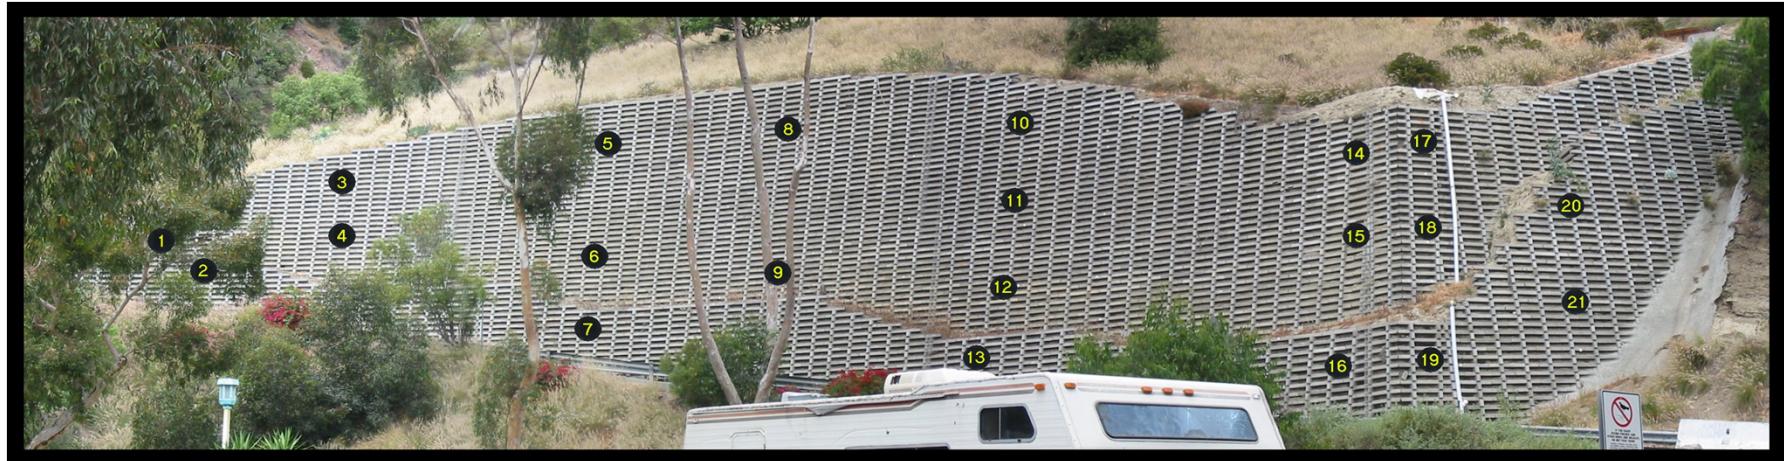

June 2006: No significant movement found. Heights on all targets show an average change of -0.02' which is related to the recomputed height of control point "CRIB" and is not movement of the crib wall.

May 2008: No significant movement found.

June 2010: No significant movement found. The Leica TCA 1100 Total Station was serviced for calibration in March 2010.

June 2012: No significant movement found. Leica TCA had a card reading problem-gun not used. TPS 1203 (SN: 214338) was used.

TARGET LOCATIONS

21 mini-prisms were set into the Crib Wall for monitoring targets July, 1997.

See following sheet for procedures and chart details.

Cove Road - Crib Wall Monitoring Survey

10/16/2013

Monitoring Procedures:

All surveys are performed following the steps listed below:

STEP # 1

Utilizing GPS Static survey techniques, measure stations "CRIB", "A" "C" and "CW-1" to two OCS Horizontal control stations (GPS 1202 & 1481) which are located outside of the project area. GPS data is post-processed and a minimally constrained adjustment is done constraining the same control station (1202) each survey if possible. Positions are compared to the 1997 survey. This data is used to check the stability, horizontally and vertically, of the three monitoring stations. Positions for stations "B", "D", and "BH3" are verified from the GPS stations using conventional techniques.

STEP # 2

Utilizing Precise leveling techniques following 2nd Order - Class II specifications, measure the vertical differences between all monitoring stations relative to four OCS Vertical control stations. This data is used to monitor any subsidence and/or uplift on the monitoring stations.

STEP # 3

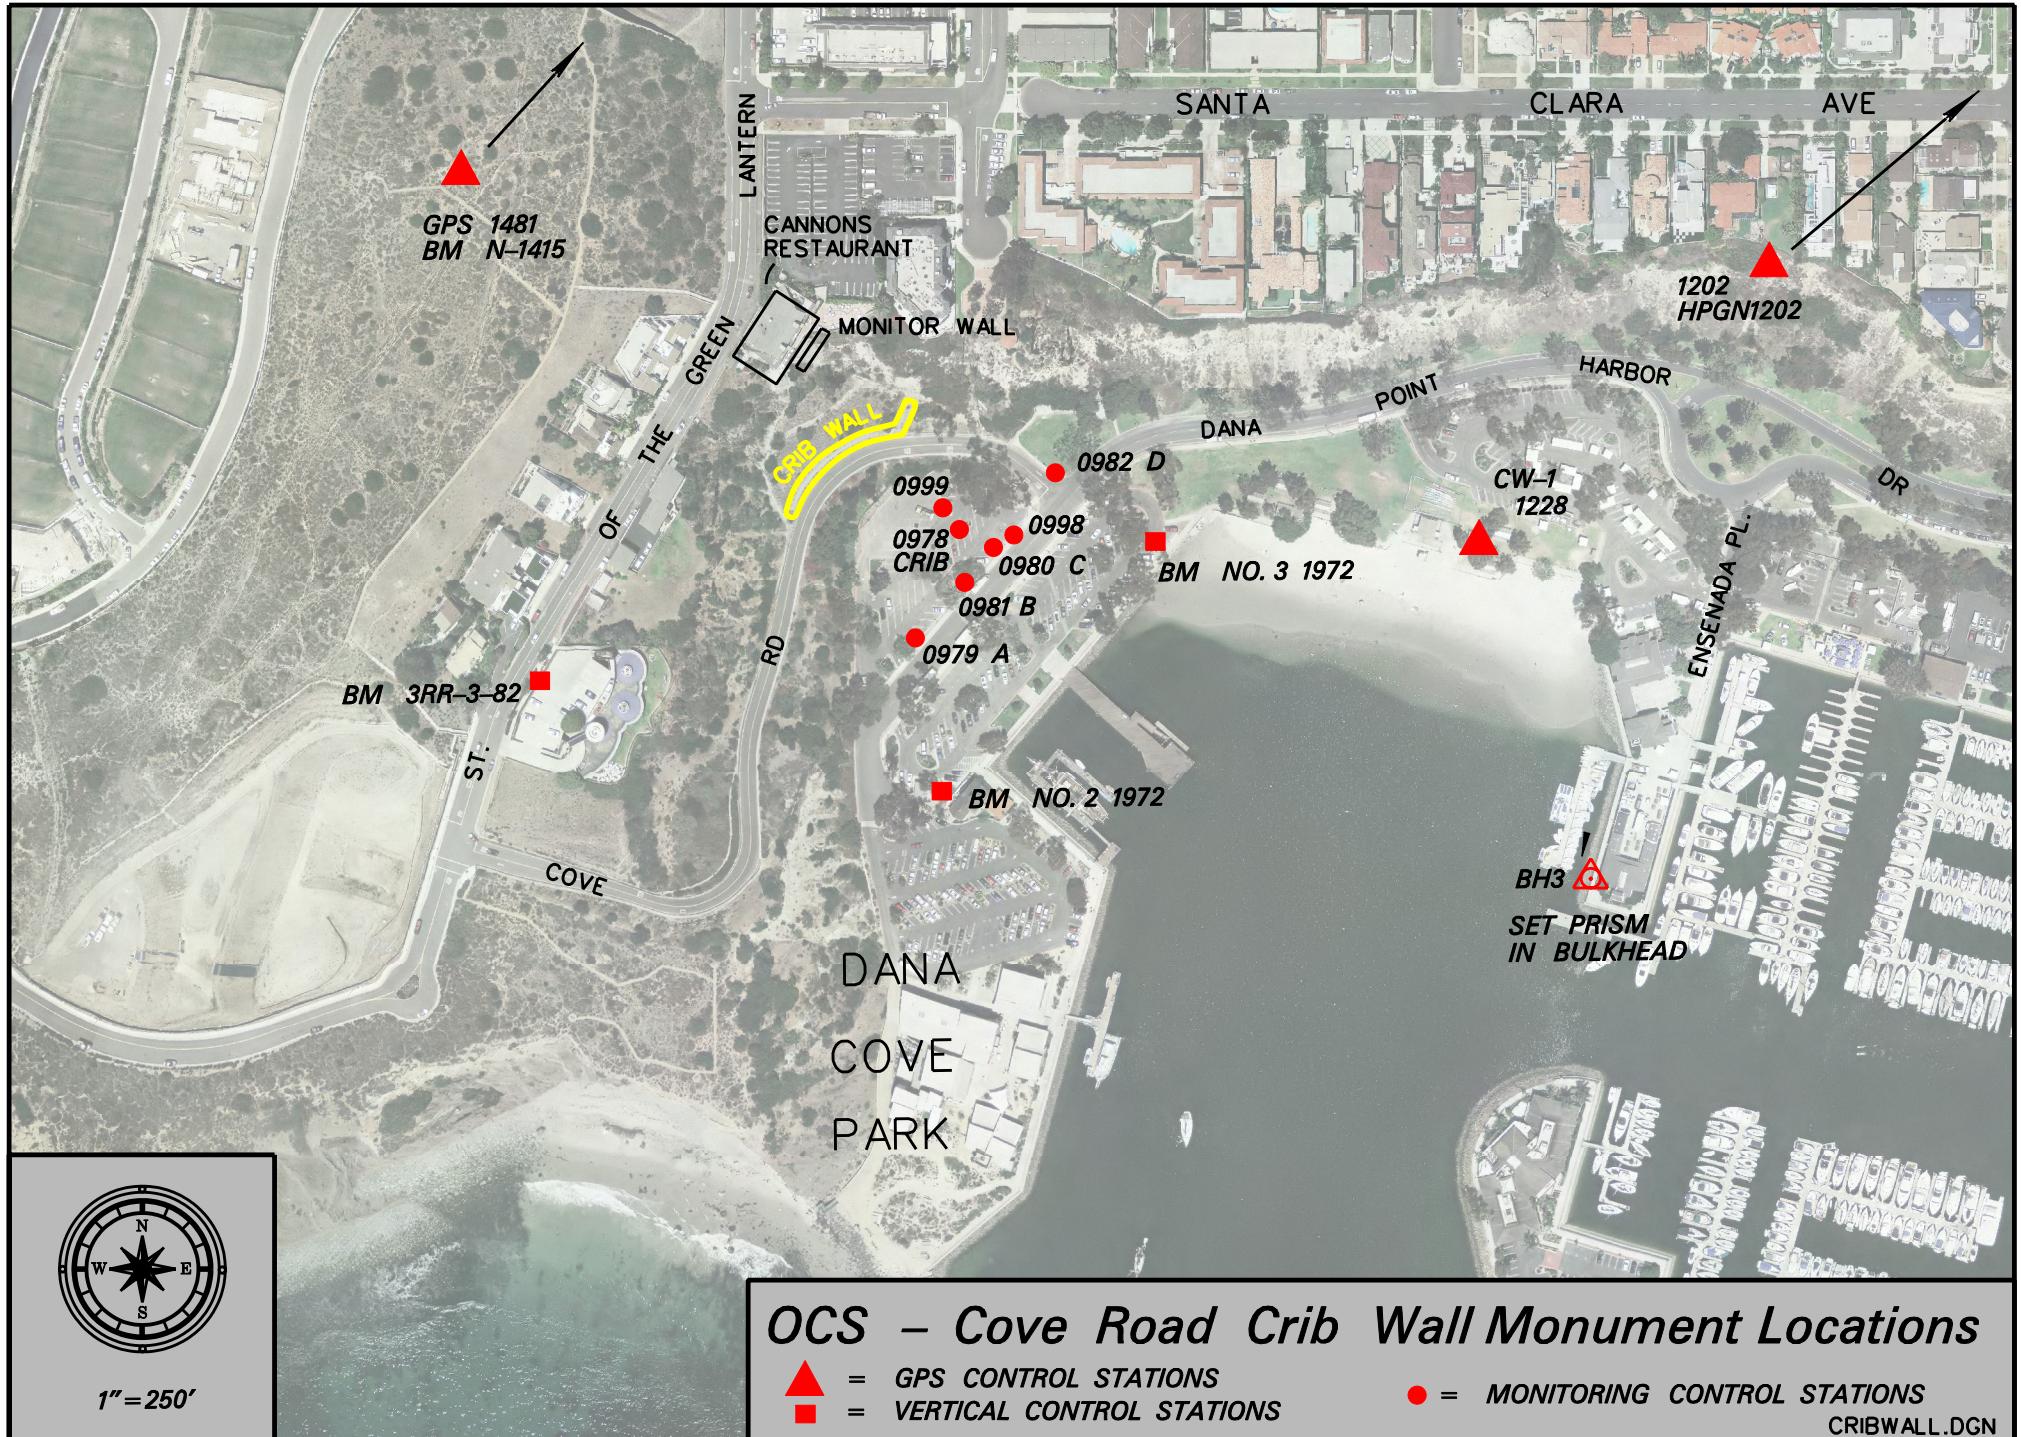

Utilize conventional surveying techniques with the Leica TPS 1203 Total Station. Measure each target 4 times (2 direct, 2 reverse). All 5 control stations observe all possible targets to achieve sufficient redundancy. The observations are then entered into a StarNet least-squares adjustment for calculation of final positions.

Comments:

Each survey is done using the same techniques with the same survey equipment if possible. A "Report Summary" is given on the first sheet and contains a short comment on each survey. Detailed information pertaining to monument descriptions and survey information are not included in this report, but can be obtained at OC Survey Divison, Geodetic Control Unit.

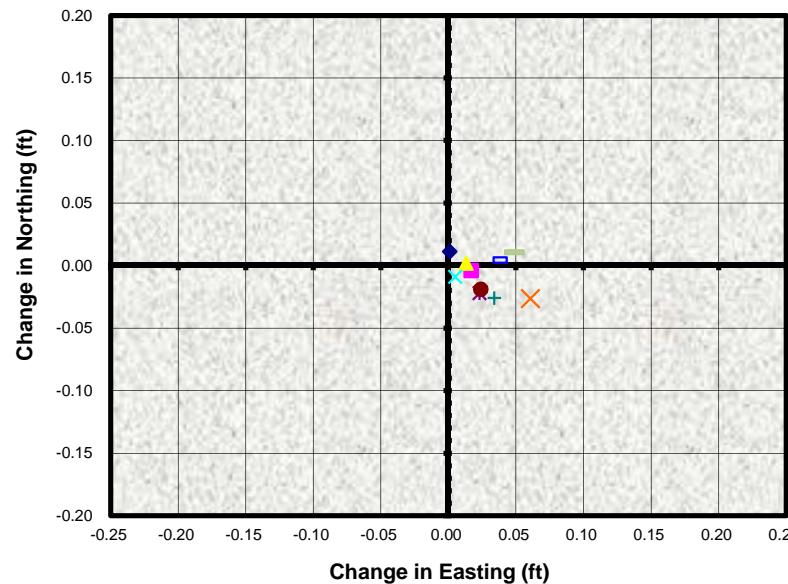

Chart Details:

Each chart contains movement (change in northing, easting, elevation) from each survey relative to the 1997 base survey for each station. All data is shown in U.S. Survey Feet.
